

Docker team at Bangalore

“ Docker started a revolution and others joined in as well, which resulted in a very vibrant ecosystem around it. ”

can easily share their application's image. With tools like Docker Compose, a multi-tier application can be defined and deployed easily, which hides all low-level details from end users. Developers can simultaneously run different versions of software on the same machine without any interference. This helps them with faster debugging. Docker and other related tools also let developers have a near production-like environment on their local environment, which helps them avoid some of the deployment issues.

Q What is the Docker community in India like?

In India, we have around 15 Docker groups which meet at regular intervals. Meetups help participants share their knowledge on various topics as well as let them do training sessions and hackathons. The Docker Bengaluru group is one of the most active and vibrant around the world.

Though we have a big user base in India, we don't have many contributors to the project. We hope to see more contributions to the Docker project from India.

Q Why should one be a part of the Docker community?

First and foremost, it is a great place to learn about Docker and the ecosystem around it. Containers are going to become

the default standard for carrying out development and deployments. Sooner or later, one has to learn about them. Being early adopters would definitely help individuals to grow professionally. Also, by being part of the community, one can learn while having fun.

Q Do you think understanding cloud technologies plays a pivotal role for any developer, sysadmin or emerging DevOps professional?

Yes, it does. Basic understanding of cloud technologies is a must for everyone. These days we use apps for booking a taxi, getting a doctor's appointment and learning online courses. All of these things are possible at scale because of some form of cloud technology. With on-demand and pay-as-you-go models of cloud technologies, companies can address their customers' requirements faster and at a lower cost. And as a developer, or someone from the QA or systems administration teams, one has to have an understanding of recent cloud technologies to build an effective solution.

Docker conference at Bengaluru, India

“ Though we have a big user base in India, we don't have many contributors to the project. ”

With the DevOps culture, smaller teams which consist of developers, QA and Ops guys work together. They also need to have a basic understanding of how everyone else in the team uses the cloud and what their pain points could be.
