

the worldwide adoption will continue to accelerate because of the compelling economic and productivity benefits open source provides. Over the next decade, more cutting-edge research, innovation, information and education — particularly related to open source security — are needed to ensure the open source ecosystem remains vibrant. We will be a leader in that effort,” said Lou Shipley, chief executive officer, Black Duck.

Europe-based Black Duck Security Research analyses security issues and attack patterns in open source software to offer actionable information on vulnerabilities. It also suggests steps to reduce risk and strategies for using the community-backed solutions effectively. Based in Vancouver, Canada, the group conducts applied research in data mining, machine learning, natural language processing, big data management and software engineering.

“Both groups will be sources of valuable research and reports throughout the year. Their work will help us innovate and improve our open source security and management solutions, and a great deal of what they do will also be shared for the benefit of the open

source community,” Shipley said.

Black Duck aims to issue periodic Open Source Security Audit (OSSA) reports analysing results of applications audited by the company. Additionally, the company is set to enhance its open source repository and database, KnowledgeBase, and expand its online community, Open Hub.

Microsoft's Chakra JavaScript engine debuts on Linux

Microsoft has announced that it is bringing its open source ChakraCore to Linux. The core of the Chakra JavaScript engine is already powering the company's Edge Web browser and Universal Windows Platform system.

At the Node.js-centric NodeSummit, Microsoft showcased the first experimental implementation of the ChakraCore interpreter and runtime on x64 Linux and OS X 10.9. The Redmond company also previewed an experimental Node.js version with ChakraCore engine on x64 Linux.

“Bringing ChakraCore to Linux and OS X is all about giving developers the ability to build cross-platform applications with the engine. The JavaScript Runtime (JSRT) APIs to host ChakraCore were originally designed for Windows, so they inevitably had a few Windows dependencies — for example, Win32 usage of UTF16-LE encoding for strings, where other platforms might use UTF8-encoded strings,” Microsoft developers wrote in a blog post.

To deliver cross-platform support on ChakraCore, Microsoft refactored and redesigned some of the major JSRT APIs. Additionally, the JavaScript engine has backwards compatibility with the previous set of JSRT APIs on Windows.

Apart from bringing the same JavaScript experience to Linux that was previously available only on Windows 10, Microsoft has bigger plans.

“It has been a little over a year since we started working on Node-ChakraCore, with the intention to grow the reach of the Node.js ecosystem. One of the

Astecs expands global footprint with new offices in Africa

Astecs has announced that it has expanded its footprint in Africa by launching local offices in Ghana and Botswana. The enterprise telecom company also has plans to extend its reach to countries like Rwanda, Kenya, Mozambique, Zimbabwe and South Africa.

Bengaluru-headquartered Astecs aims to deliver open source solutions in some of the main African markets to cater to organisations across multiple verticals in the continent.

“We are focusing significantly on developing our partner ecosystem for increased market penetration across the globe. As part of the global expansion programme, Astecs is strengthening its presence in recognition of the huge potential of the African market,” said Binish V.J., head – international business, Astecs, in a statement. “Our business strategy in Africa focuses on understanding the specific needs of the customers and delivering cutting-edge solutions, especially in the enterprise communications segments,” he added.

Astecs considers that extensive development of communications infrastructure and changing business and ICT trends have created new opportunities in African countries. Therefore, the company has found ways to expand its presence and offer a broad range of cost-effective, flexible and versatile communication solutions.

Through the power of open source and IP, Astecs develops enterprise solutions. It has Asterisk diallers and various other open source communication solutions that result in efficient operations with lower TCO, yielding quick returns on investment.
