designed for third-party Android developers to let them enable their apps with the ability to access passwords directly from password managers like Dashlane. Although Dashlane is the founding firm behind the new project, other password managers such as 1Password, LastPass and mSecure will also get a chance to leverage the advancements from the open API.

"To stay one step ahead of the market demand, Google and Dashlane are helping create a seamless, universally-acceptable Android app authentication solution to increase your online security," Dashlane community manager, Malaika Nicholas, said in a statement.

Google and Dashlane are set to make Open Yolo available on other mobile platforms too. This would broadly change the way you use passwords today and, ultimately, transform security across mobile platforms.

"In the future, we see this open API going beyond just Android devices, and becoming universally-implemented by apps and password managers across every platform and operating system," Nicholas added.

Open Yolo is not the only tool by Google to upgrade password management on its Android operating system. The search giant added the Smart Lock feature to Android Lollipop last year, which keeps devices unlocked when these are close to the body of their users.

The release of Open Yolo appears to be a competitive move by Google to take on Apple. The Cupertino company has been providing its native password management system within iOS from the last several months. Users can store a large number of their passwords and grab them when required with just a single tap on the screen.

However, unlike Apple's attempt to store passwords under one roof, Open Yolo by Google is an open source project. This will help the search giant attract more interest and support from the community.

Linux kernel 4.8 to natively support Microsoft Surface 3

While Linus Torvalds is busy developing Linux kernel 4.8, it has now been found that the next version of the open source operating system will natively support Microsoft's Surface 3. The new support emerges from a touchscreen controller driver that will enable the last year's Surface tablet to run Linux flawlessly.

Dmitry Torokhov, Linux kernel input subsystem maintainer and one of the active contributors to Linux 4.8, in a recent email to Torvalds suggested a driver integration for the touchscreen controller found in the Surface 3. Moreover, a changelog available in the same email hints at a tweak to support the Surface Pen stylus that enhances the functionality of the Windows-running tablet.

Support for the new drivers is apparently a part of the Linux kernel 4.8 first release candidate, which is already available for testing purposes.

"This [Linux kernel 4.8 first release candidate] seems to be building up to be one of the bigger releases lately, but let's see how it all ends up. The merge window has been fairly normal, although the patch itself looks somewhat unusual: over 20 per cent of the patch is documentation updates, due to conversion of the DRM and media documentation from DocBook to the Sphinx doc format," Linux creator Torvalds wrote in a community email.

Linux kernel 4.8 could bring the Surface 3 back to life. Interestingly, the new development will give Linux users an option to use Microsoft's in-house hardware for its open source developments.
