

tuned makes all the required tweaks for you dynamically. You can download it by using the following command:

```
$apt-get install tuned
```

To start the daemon, use the command given below:

```
$tuned -d
```

To check the available profiles, you can see *man tuned-profiles*. You can create your own profile but for the best network performance, *tuned* already has some interesting profile options like network-throughput and network-latency. To set a *tuned* profile, use the following command:

```
$tuned -p network-throughput
```

Making changes permanent

The changes made by *sysctl* get lost on every reboot; so to make them permanent, you need to save these changes to */etc/sysctl.conf*.

For example:

```
$echo 'net.ipv4.tcp_moderate_rcbuf=1' >>/etc/sysctl.conf
```

There are many more tuning parameters available in

Linux, which you may want to change for better network performance. But it is recommended that you understand these features well before trying them out. Blind tuning can only be good if you benchmark continuously and properly to check if the changes are leading to positive results.

Interesting places to find other available parameters are *net.core* and *net.ipv4*.
