

Let's Get Acquainted **with PHP**

PHP is a server side scripting language that is embedded in HTML. It is used to manage dynamic content, databases, session tracking, and even build entire e-commerce sites. This article gives an introduction for newbies and wannabe PHP users.

PHP (Hypertext Preprocessor) is the most widely-used open source scripting language. It is particularly suited for Web development and can be entrenched into HTML. Its syntax is borrowed from C, Java and Perl languages. In 1994, Rasmus Lerdorf released the primary version of PHP. This language manages active content, databases and can even be used to construct a complete e-commerce site. PHP supports various known databases like MySQL, Oracle, PostgreSQL and MS SQL Server.

PHP is very fast in its implementation, particularly when organised as an Apache component on the UNIX side. Also, once the MySQL server is on the go, it implements even the most complex queries with big result data sets in record-setting times. It is the language that supports a huge number of chief protocols like IMAP and LDAP. PHP incorporates a C language-like syntax.

General uses of PHP

- It performs functions of the system. For example, it can produce, unlock, examine, write and close files on a system.
- It can handle various forms—it can collect data from files and save it to a file via email.
- The user can insert, remove and alter elements within the database through PHP.

- It has the right to use cookies variables and set cookies.
- PHP can limit users to accessing only a few pages of your website.
- PHP can encrypt data.

Characteristics of PHP

The most important characteristics of PHP are:

- Effortlessness
- Effectiveness
- Safety
- Suppleness
- Awareness

How PHP can be used

Let's begin with a simple PHP script. Project 1! is a vital example, so let's first make a welcoming Project 1! script. PHP is entrenched in HTML, which means that HTML includes PHP statements such as:

```
<html>
<head>
<title>
My First PHP Page
</title>
</head>
```
