

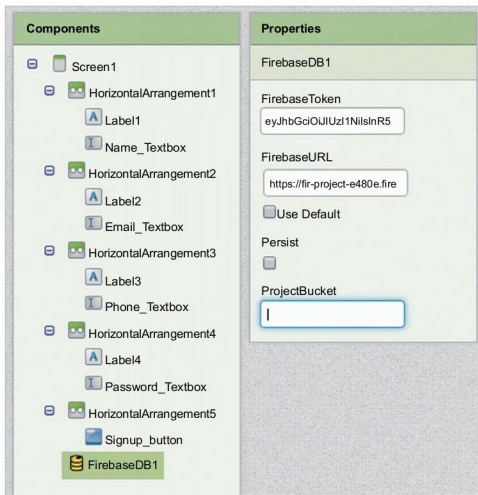

Figure 9: Set the URL to the Firebase component

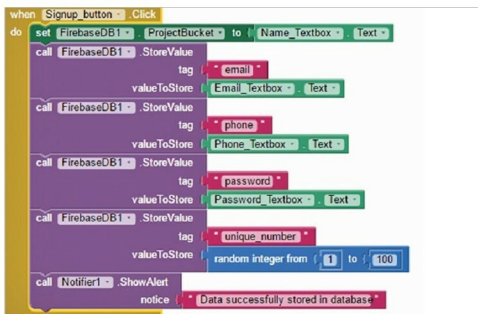

Figure 10: Block editor image 1

- number should also be generated for the user.
- Being admin, the user should be able to change the unique number in the database.
- The same number should be

displayed on the screen in the *Notifier*.

So let's move on and add these behaviours using the block editor. I hope you remember how to switch from designer to block editor. There

is a button available right above the *Properties* pane to do this.

Block editor blocks

I have already prepared the blocks for you. All you need to do is drag the relevant blocks from the left side palette and drop them on the viewer. Arrange the blocks in the same way that you see them in Figure 10. I will explain each block, what it does and how it is called.

- On clicking the button, we are setting the Firebase bucket to the name of the user.
- The Firebase bucket is a kind of folder that will contain other sub-folders or details within.
- With a click of the button we save each detail provided by the user with the unique tag name.
- The concept of tag name and value is already known to you since you have used TinyDB.
- The *Notifier* in the end displays the alert that the data has been successfully added.

Your database will look like what's shown in Figure 11 once you fill the entries and click on the *Sign Up* button.

- Once done with the data storing, this block will keep track of the data changes.
- Specifically, this will display the notice if the value of the unique number has been changed.

Now you are done with the block editor too. Next, we will move to download and install the app on your phone to check how it is working.

Packaging and testing

To test the app you need to get it on your phone. You first have to download the application on your computer and then move it to your phone via Bluetooth or USB cable. I'll tell you how to download it.

- On the top row, click on the *Build* button. It will give you the option to download the apk to your computer.
- After the download is successful, the application will be placed in the *Download* folder of your directory or the preferred location you have
