set for it.

- Now you need to get this *apk* file on your mobile phone either via Bluetooth or via USB cable. Once you have placed this file on your SD card you need to install it. Follow the on-screen instructions to install it. You may get a notification or warning saying that you are installing from an untrusted source. Allow this from the *Settings* and after successful installation you will see the icon of your application in the menu of your mobile. This is the default icon, which can be changed,

and we will tell you how as we move ahead in this course.

I hope your application is working exactly as per the requirements you have given. Now, depending on your usability and customisation, you can change various things like image, sound and behaviour also.

The author has a B. Tech in electronics and communication, is a freelance writer and an Android app developer. He currently works as an automation engineer at Infosys, Pune. He can be contacted at meghraj Singh01@rediffmail.com or meghrajwithandroid@gmail.com

Debugging the application

We have just created the prototype of the application with very basic functionality, based on what the user may be interested in. Now let's look at the various possible features that should be provided in your app so as not to annoy the user, and require some serious thought. Consider the following:

- Wouldn't it be nice to add some data validation upon entering the data, such as no field should be blank?
- In the phone number field, can we have only digits or numbers?
- Can we add the validation of the email id by checking '@' in the text provided?
- Taking the same things into consideration, can we design a log in page as well?

These are some features in the app the user will be pretty happy to see implemented.

Think about how you can integrate these into the application. Do ask me if you fail to accomplish any of the above cases.

You have successfully built another useful Android app for yourself. Happy inventing!
