

## OpenClaw adoption wave lifts China's tech stocks

OpenClaw, an open source autonomous AI agent, is driving a wave of investor enthusiasm in mainland China's stock markets, lifting shares of companies linked to the technology even as broader market sentiment remains subdued.

Stocks viewed as compatible with OpenClaw have rallied sharply. Hangzhou Shunwang Technology, which provides online entertainment networking platforms, climbed 22% in Shenzhen in one week. Telecom software developer Talkweb Information System rose 12% in the same period. By comparison, the CSI 300 Index gained just 0.2%, highlighting the divergence created by the OpenClaw-driven trade.

Unlike conventional AI chatbots that mainly respond to queries, OpenClaw can execute tasks on computers and mobile devices. The tool can sort documents, install software, perform online shopping and carry out other automated functions, signalling a shift from answering questions to performing real-world tasks.

"While it's in the early stages, [OpenClaw] remains the key to connecting large language models to the end-user scenarios," said Wang Jun, analyst, BOC International, Shanghai. "It's expected to make the breakthrough from 'answer question' to 'perform tasks'." Originally known as Clawdbot and Moltbot, OpenClaw was developed by Austrian programmer Peter Steinberger and released last year. The open source agent was acquired last month by Microsoft-backed OpenAI.

Adoption signals are strengthening in China. More than 1,000 people gathered outside Tencent Holdings' headquarters in Shenzhen after receiving invitations to install OpenClaw on their devices, while the Shenzhen government has announced subsidies for start-ups adopting the tool.

confidence scores. Findings appear in a unified dashboard, while every change requires developer approval.

Explaining the difference, the company said: "Existing analysis tools help, but only to a point, as they usually look for known patterns [...] Rather than scanning for known patterns, Claude Code Security reads and reasons about your code the way a human security researcher would: understanding how components interact, tracing how data moves through your application, and catching complex vulnerabilities that rule-based tools miss."

"Nothing is applied without human approval: Claude Code Security identifies problems and suggests solutions, but developers always make the call."

The open source impact is already tangible. Using Claude Opus 4.1, the company uncovered more than 500 previously undetected vulnerabilities in production open source codebases and is conducting responsible disclosure with maintainers.

The tool has been stress-tested in Capture-the-Flag events and evaluated with Pacific Northwest National Laboratory for critical infrastructure defence. The move follows growing risks flagged by Tenzai, which warned that AI-built apps from platforms such as OpenAI, Cursor, Replit, and Devin can leak data or mishandle funds.

## Baidu's DuClaw to provide instant access to the OpenClaw agent platform

Baidu has launched DuClaw, a zero-deployment service that enables instant access to the OpenClaw platform through Baidu AI Cloud, aiming to remove technical barriers that have slowed developer adoption of open source AI agents.

OpenClaw is an open source AI agent platform that has attracted growing global

developer interest. The system enables AI agents to retrieve information, coordinate workflows, and perform actions across applications.

Despite strong interest, deploying OpenClaw has often proved challenging for developers. Environment configuration complexity, model

integration requirements, and system reliability concerns have remained common obstacles. DuClaw addresses these challenges by eliminating the deployment process entirely.

The service removes several technical steps typically required for deployment, including selecting system images, configuring servers, integrating model API keys, and setting up infrastructure. Developers can instead access OpenClaw agents instantly through a web interface.

DuClaw operates as a fully managed service hosted on Baidu AI Cloud's high-performance infrastructure, providing a ready-to-use OpenClaw environment.

The platform also includes pre-built capabilities linked to Baidu services such as Baidu Search, Baidu Baike, and Baidu Scholar, enabling agents to access trusted information sources directly. It supports multiple mainstream foundation models, allowing users to select models that best match their needs.

Currently available via web interface, DuClaw is expected to integrate with enterprise collaboration platforms including WeCom, DingTalk, and Feishu.
