

DeepSig contributes AI-RAN expertise and hardware acceleration support, including NVIDIA GPUs, enabling spectrum sensing, neural receivers, neural scheduling and AI-native air interfaces, alongside efficient RAN processing and reference designs.

“OCUDU creates the foundation for a more open and software-driven RAN ecosystem,” said Jim Shea, CEO, DeepSig, noting that an open CU/DU platform enables rapid experimentation, interoperability and deployment.

Arpit Joshipura, General Manager, Networking, Edge and IoT, Linux Foundation, added that DeepSig’s participation helps “advance interoperable CU/DU software and speed innovation for 5G and early 6G networks.”

Alibaba’s AI assistant CoPaw comes with persistent memory

The AgentScope team within the Alibaba ecosystem has released CoPaw, an open source personal AI assistant designed as a Personal Agent Workstation that users can install, host, and manage themselves. Released under the Apache License 2.0, the platform aims to eliminate vendor lock-in by allowing users to run, modify, and scale the assistant independently.

A key feature of CoPaw is its persistent memory system, powered by ReMe (Remember Me, Refine Me), a specialised memory management framework. Unlike typical stateless chatbots, the system enables the assistant to retain long-term contextual information across interactions.

Memory is handled through file-based storage, making it editable and portable, and through a hybrid retrieval mechanism combining semantic vector search (0.7 weight) and BM25 keyword search (0.3 weight). A context compaction feature summarises long conversations to preserve important details without exceeding LLM context limits.

CoPaw supports both local and cloud deployments. It can run entirely offline using local models through Ollama or llama.cpp, ensuring sensitive data never leaves a user’s network. Alternatively, it can be deployed on cloud infrastructure such as Alibaba Cloud Elastic Compute Service (ECS) or other VPS environments.

The assistant is designed for multi-platform integration, supporting channels including Discord, Slack, DingTalk, Feishu, and iMessage, enabling a single AI assistant to operate across multiple communication platforms.

Built on the AgentScope framework, CoPaw allows developers to create custom Python-based skills, enabling tasks such as database queries, web scraping, or enterprise workflow automation. It also includes cron-based scheduling for autonomous task execution and supports switching between models—including GPT-based, Llama, and Qwen models—without losing stored memory.

Open VSX Registry crosses the 300 million monthly download mark

The Open VSX Registry has surpassed 300 million downloads per month, marking a major milestone for the open source extension marketplace and underscoring its growing role as critical infrastructure for modern developer platforms.

Operated under the Eclipse Foundation, the vendor-neutral registry now handles peak daily traffic exceeding 50 million requests, hosts more than 10,000 extensions, and supports over 6,500 publishers. It has become a production dependency for developer platforms serving millions of users worldwide.

GitHub plugin helps developers automate supervision of Anthropic’s Claude

Peon Ping, a free, open source plugin built by brothers Gary and Tony Sheng, is gaining rapid adoption by helping developers manage Anthropic’s Claude (Claude Code) with simple audio alerts when the AI asks questions, needs approvals, or goes idle, reducing the need to constantly babysit terminals.

Usage has climbed to roughly 100,000 developers, with momentum accelerating after visibility on *Hacker News* and integration inside Visual Studio Code, which serves an estimated 50 million users.

Hosted on GitHub, the tool supports community-made sound packs and has become an example of how grassroots, open source utilities are shaping AI workflows faster than proprietary vendors.

The plugin was originally built in about an hour by Tony Sheng and open sourced immediately. Tony later handed maintenance to Gary, a former Google engineer and founder of Applied AI Society. “It’s probably the stupidest thing I’ve ever shipped. And according to everybody that has used it, it’s also incredibly useful.” Tony wrote.

Inspired by *Warcraft III: Reign of Chaos* peon characters, the tool adds nostalgic game sounds and a playful ‘vibe coding’ experience, alongside an optional Clippy-style desktop companion.

Peon Ping also reflects a wider trend of viral open source AI agents such as OpenClaw, whose creator joined OpenAI.
