

Why Enterprises Should Opt for a Hybrid Cloud

A hybrid cloud is not just about saving costs — it is about the enterprise becoming more agile, efficient and productive.

Enterprises are expanding their usage of clouds to maintain their competitive edge, accelerate innovation and transform interactions with customers, employees and partners. Cloud solutions provide the much-needed flexibility to develop the capabilities necessary to innovate and seize new business opportunities.

A hybrid cloud comprises two or more models (on-premises, private cloud, and public cloud), which help enterprises to distribute their applications and manage workloads across multiple environments, enabling availability, resiliency and flexibility. This involves choosing a model for a given application where the most business benefits are realised.

CIOs across industries are busy working with multiple cloud providers, essentially to retain what works and find out what to improve across the enterprise cloud estate. A fundamental decision they need to make is how to balance the on-site, remote, public and private elements of a cloud model and to adopt emerging technologies. They need to consider the following before promoting a hybrid cloud model:

- Does the enterprise have the right business culture to embrace rapid change?
- What value does the hybrid cloud bring to their business?
- Will it help them to lower costs, improve processes and better manage security?

- The capability to address change management when moving to a hybrid cloud while maintaining business continuity must be looked into.
- Does the enterprise have proper use cases for hybrid cloud adoption?
- What is the volume of cloud service requirement for new application development on existing architectures, and for the development of next-generation applications?

A hybrid cloud offers flexibility, scalability, security, data sovereignty, compliance, and cost-effectiveness based on individual business objectives. Some of the top companies offering hybrid cloud platforms are Amazon
