

Linux pioneer SUSE valued at \$6 billion for potential sale

EQT AB is exploring a potential sale of open source software company SUSE in a deal that could value the enterprise Linux pioneer at up to \$6 billion (€5.1 billion), according to two people familiar with the matter cited by Reuters.

The Sweden-based private equity firm has hired investment bank Arma Partners to sound out private equity investors regarding interest in acquiring SUSE. The process is still at an early stage, and there is no certainty that EQT will proceed with a transaction, the sources said.

EQT, the majority owner of SUSE, took the company private in 2023, valuing it at €2.72 billion (\$2.96 billion). A sale near the \$6 billion mark would roughly double the company's valuation within about two-and-a-half years.

SUSE generates about \$800 million in annual revenue and more than \$250 million in EBITDA (earnings before interest, taxes, depreciation, and amortisation). Based on these metrics, the company could fetch between \$4 billion and \$6 billion in a potential sale.

While some investors worry that artificial intelligence tools could displace existing software products, others see SUSE as a potential beneficiary of AI adoption, as enterprises require robust infrastructure to deploy AI workloads.

SUSE develops open source enterprise software used to run applications across cloud servers, mainframes, and edge devices. Its customers include Walmart, Deutsche Bank, and Intel, and the company says more than 60% of Fortune 500 firms rely on its technology for some workloads.

NVIDIA's NemoClaw could power AI-based warfare for India

NVIDIA has introduced NemoClaw, an open source, chip-agnostic AI platform designed to deploy agentic AI systems. The system can enable defence organisations

to run autonomous AI agents while retaining full control over data and infrastructure.

For India, NemoClaw aligns closely with the ambitions of the IndiaAI Mission and the Defence Research and Development Organisation's (DRDO) Evaluating Trustworthy Artificial Intelligence (ETAI)

framework. The platform can operate entirely on domestic infrastructure, integrate with models such as BharatGPT, and run on approved hardware ranging from DRDO accelerators to edge devices deployed in extreme terrain.

Built on the Nemotron-3 model family, NemoClaw delivers up to nine times faster inference and 20 per cent higher reasoning accuracy on multi-step benchmarks. Its smallest variant uses about 3.6 billion active parameters per token, enabling deployment even in bandwidth-constrained forward locations.

India already uses AI operationally. During Operation Sindoor in 2025, AI tools analysed 26 years of intelligence data in real time, helping achieve 94 per cent strike accuracy. Currently, 129 AI projects are underway under the Defence AI Project Agency.

Potential applications include border surveillance along the Line of Actual Control, maritime monitoring across India's coastline, predictive logistics, cyber defence, advanced training simulations, and coordinated unmanned combat aerial vehicle operations.

Chief of Defence Staff General Anil Chauhan emphasised the shift towards AI-driven warfare, stating, "Artificial intelligence is going to play a major role in warfare tomorrow, and so would autonomous systems."

However, Chandrika Kaushik, Director General of DRDO, cautioned that reliance on foreign technologies must be carefully evaluated to ensure trustworthiness and strategic autonomy. Defence experts recommend audits, localised code forks, and air-gapped deployments before large-scale adoption.

Anthropic embeds AI-powered security scanning in Claude Code

Anthropic has introduced Claude Code Security, a built-in AI feature inside Claude Code that scans entire repositories and generates patches for software vulnerabilities, positioning the tool as an automated security reviewer for open source ecosystems.

The system analyses code through multi-stage verification, detects complex logic flaws that rule-based scanners often miss, and produces fix suggestions with severity grading and
