

humbling show of faith in our product and team, who are trusted to deliver and help you – our beloved users – use open source code and stay secure,” Podjarny wrote.

“We integrate elegantly into the development process and find known vulnerabilities in your open source elements and fix them,” Podjarny explained. “The company monitors the code right in your GitHub repository, but if you’re concerned about sharing your open source code with a third-party company, you need not worry about that,” he said, adding, “You are only giving us access to manifest files that dictate the files you are going to use.”

Since Snyk supports the vast majority of languages that users need, the firm plans to cover open source libraries for all the languages in developers’ code bases. The firm also intends to mature its support offerings for the more recently added languages to match the level of subtle understanding and fix the capabilities veteran languages enjoy.

BLOCKS unveils Android based smartwatch framework

Aiming to make it easier for other developers to build a smartwatch OS, BLOCKS has kicked off an initiative, christened Project OpenWatch—a pure open source project.

The project provides a Linux kernel and an Android Oreo board support package for watches that use the MediaTek MTK6580M chipset used in the BLOCKS’ smartwatch. Currently, the market already has three big names in the smartwatch operating system space — Apple’s WatchOS, Google’s Android Wear, and Samsung’s Tizen. For BLOCKS’ upcoming modular smartwatch, the company has developed its own

Android-based software to support the plug-and-play modules.

While BLOCKS doesn’t offer the source code for its full operating system, providing this framework will make it easier for third-party developers to create their own custom smartwatch operating systems that can run on MTK6580M watches, including BLOCKS’ watch.

Innovations in Red Hat’s management portfolio

To accelerate deployments of Red Hat-powered cloud environments, the company has announced new innovations in its management portfolio. The company’s latest releases of Red Hat Satellite and Red Hat CloudForms enable enterprises get greater control of their hybrid cloud infrastructures. They also push automation and simplify ongoing infrastructure management.

“Being able to scale and deploy more quickly are key capabilities of digital transformation, where enterprises embrace emerging digital technologies to fuel differentiated products and services. With this announcement, Red Hat continues to build out its management offerings based upon the powerful automation capabilities of Ansible, helping customers to adopt new technologies while maintaining greater control over their hybrid cloud infrastructures,” shared Joe Fitzgerald, vice president and GM - management, Red Hat.

The heterogeneous nature of modern enterprise computing can often require a new type of management solution, one that can improve scale, speed and stability while still providing a clear picture across disparate infrastructures. The latest releases of Red Hat Satellite and Red Hat CloudForms help address these needs. They provide enhanced integration with Red Hat Insights and Red Hat Ansible Tower,
