

Buku: A Bookmark Manager in the Command Line

Managing bookmarks is an important aspect of improving our experience on the Web. When used judiciously, bookmarks can save us a lot of time, effort and resources. This article familiarises readers with Buku, a command line bookmark manager.

Bookmarks are like shortcuts to Web pages. Browsers are adequate when it comes to bookmarks but to access the latter again, you have to open your browser. There's no independent solution for bookmarks that protects your privacy and safeguards your data, which is why you need to try Buku.

Buku is a lightweight and flexible bookmark manager that comes with a command line interface (CLI). It possesses all the necessary functionalities of the typical bookmark manager and it also has some unique features like being self-hosted, having manual encryption support, the capability to shorten and expand URLs; the auto import of bookmarks from Firefox, Google Chrome and Chromium; automatic updates of the bookmarks, integrated text editor support for adding the bookmarks, and much more.

In this article, we're going to see how Buku works its magic through the CLI in Linux, but if you prefer a GUI version of Buku, the GUI integration is explained in its GitHub project page.

Installation

Let's install Buku in Debian based systems. Before installation, take a look at some of the system requirements.

Buku is a Python based package; so let's use the Python-Pip package to install the necessary packages.

As I prefer Python3, let's use the Python-pip3 package, which won't be available in the system by default; so you'll have to install this package manually using the following command:

```
$sudo apt-get install python3-pip
```

Once you're done, use Python-pip3 to install the following packages in the system:

```
$sudo pip3 install urllib3 cryptography beautifulsoup4 requests
```

After completion, proceed with the Buku installation by adding the Buku PPA by using the following command:

```
$sudo add-apt-repository ppa:twodopeslaggy/jarun
```

Now update the system, as follows:

```
$sudo apt-get update
```
