

```

admin@JaxSparrow ~ $ buku -S privacy search_engine
1. DuckDuckGo [2]
  > https://duckduckgo.com/
  + A Search Engine that respects your privacy
  # privacy.search_engine
2. StartPage Web Search [7]
  > https://www.startpage.com/
  + A Private Search Engine
  # privacy.search_engine
3. Swisscows the secure search engine [8]
  > https://swisscows.com/
  + a private search engine from switzerland
  # privacy.search_engine,swiss

```

Figure 4: Search all keywords

update our bookmark to use the site's most recent name from the Web, by using the following command:

```
$buku -u 2
```

In the above command, the number '2' denotes the index of the bookmark in the database.

If you prefer only to update the comment of a particular bookmark, you can use the '-c' option along with the updated comment.

The *comment* section of the Wikipedia article that was added earlier can be updated by using the following command:

```
$buku -u 7 -c this a Wikipedia article on Free Software
```

Similarly, you can update the URL, title and tags with any one of the options '--url', '--title' and '--tags', along with their relevant data.

Deleting a bookmark

To delete a bookmark, you need to use the -d option along with its index number, as shown below:

```
$buku -d 5
```

The above command will delete the bookmark in Index 5 and the last bookmark will take the deleted bookmark's place so that no void space exists in the database.

To delete all the bookmarks, no index numbers are to be given:

```
$buku -d
```

If you want to delete bookmarks from a specific range, provide the range as an argument, as follows:

```
$buku -d 5 10
```

Searching

To search for a bookmark, you can use tags as your

```

admin@JaxSparrow ~ $ buku -s privacy search_engine
1. DuckDuckGo [2]
  > https://duckduckgo.com/
  + A Search Engine that respects your privacy
  # privacy.search_engine
2. StartPage Web Search [7]
  > https://www.startpage.com/
  + A Private Search Engine
  # privacy.search_engine

  > https://diasporafoundation.org/
  + Social Network where the control belong to users only.
  # privacy,selfhosted,social

```

Figure 5: Search one keyword

primary source, because as long as your tags are relevant to your bookmarks, they will help you greatly in finding the relevant bookmarks.

```
$buku --tag privacy, search_engine
```

The above command will list the bookmarks that have either 'privacy' or 'search_engine' in their tags. You can refine your search by making all the tag inputs match a bookmark.

```
$buku --tag privacy + search_engine
```

You can also run a search based on the keywords of the bookmarks.

```
$buku -s privacy search_engine
```

The above command will list the bookmarks that have a match for the keywords 'privacy' and 'search_engine' in their URL, tags and comments.

If you want to search bookmarks with any one of the keywords matching words in the URL, tags, and comments, use the following command:

```
$buku -s privacy search_engine
```

Encryption

Encryption is an important feature of Buku, since all the bookmarks are controlled and maintained by the user itself. Encryption makes sure that only authorised personnel access the bookmarks so that the privacy and integrity of the bookmarks remain pristine.

Buku uses the AES256 algorithm for encrypting the database but to use encryption, first the database needs to be locked by supplying a password of your choice.

```
$buku -l
```

The above command will ask for a password to lock the database. Once you supply the password, you will see that
