

changes so that vendors could create custom images with little changes. As the deployment matured, along with demand from the community, the team took steps to create reusable independent modules. The project was split into two major reusable components, the image build part and the deployment part. This gave vendors better control over the consumption of Kolla based container images in their existing frameworks—as an alternative to bare-metal/VM based deployment.

## Deployment with Kubernetes

As Kubernetes matured, and in response to requirements from major vendors who wanted to use Kubernetes as their orchestration platform, Kubernetes based deployment again came into the picture for Kolla images. This development is still in its nascent stage, with the 1.0 milestone in sight with core services deployment. It is still getting rewritten with different existing Ansible automation features as well as a native Kubernetes tools like Helm.

## Contributing to Kolla

The Kolla project is now one of the popular repositories in the OpenStack community with containerised images of almost all Big Tent projects. The deployment automation for most of the projects is also complete with the remaining undergoing reviews. There are three major deliverables:

- kolla, the image build repository
- kolla-ansible, the Ansible based deployment automation
- kolla-kubernetes, the Kubernetes based deployment automation

The Kolla repositories are hosted under OpenStack GitHub, under the Apache 2 licence. Have a look at the project documentation, connect with the community on Freenode at [#openstack-kolla](#) channel or subscribe to the [openstack-dev](#) mailing list. The Docker images are also available on Docker Hub. You can have a look at project milestones, features and bug reports on Launchpad.

# Scaling MySQL Databases on Cloud

50+ successful DB migration to cloud with zero downtime

100+ happy clients under Mydbops managed service for MySQL on cloud

30-50% cost reduction at DB infra

50% reduction in TCO for databases

2 TB data on a Aurora Cluster with 85K Queries Per Second

Ensured seamless Switchover and Failover with SQL LB's

Zero Downtime and easy DR switching based on business requirements

Auto read/write scalability for databases on cloud

Trusted DB Partners of many growing startups
