

Didn't I already tell you that there are no Easter Eggs in this program?

```
Saptitude -vvv moo
Stop it!
```

```
Saptitude -vvvv moo
Okay, okay, if I give you an Easter Egg, will you go away?
```

```
Saptitude -vvvvv moo
All right, you win.
```

```
Saptitude -vvvvvv moo
What is it? It's an elephant being eaten by a snake, of course.
```

Here, 'v' is a 'verbose file'.

An exit shortcut

We use various terminal commands that are interpreter based. To come out of these, just press `Ctrl+D`. This shortcut works for the Linux, Python, ssh, sftp and MySQL terminals.

Print a distinct extension in a folder

To print distinct extensions in a given folder, use the following command:

```
find /path/to/your/directory -type f | awk -F. '{array[$NF]++;print $NF}'
```

This command will capture the extensions in a given folder by separating the field names with a period ('.') and printing the last entry, i.e., the extension. For regular files that don't have any extension, the absolute path of the file gets printed.

Run as the super user using 'nautilus'

Instead of working from the terminal using `sudo` every time, type the following command on the terminal:

```
$sudo nautilus
```

As soon as you run this command, a file explorer will be opened. All actions that you wanted to do on the terminal using the `sudo` permission can now be done in this file explorer's GUI.

Remove unwanted and duplicate files using FSInt

With time, we start keeping the same files with the same name (or a different name) on various folders in our system, either knowingly or unknowingly.

Here is an easy way of getting rid of duplicate and unwanted files present anywhere in your computer. *FSInt* is open source software for Linux systems. It can be used on both the command line and GUI modes. First, you need to install it to start using it.

So type the following commands in the terminal:

```
sudo apt-get update
sudo apt-get install fsint
```

After successful installation, you can use *FSInt* by searching for it in the Ubuntu dashboard.

Run a command and come back to the current working directory immediately

You can run a command in Linux and immediately come back to the current directory. All you need to do is to run the command in parentheses.

```
$(cd /home/abhishek/Documents/ && ls)
```

The above command will list all the files in the directory *Documents* and come back to the present directory immediately.

Share Your Open Source Recipes!

The joy of using open source software is in finding ways to get around problems—take them head on, defeat them! We invite you to share your tips and tricks with us for publication in *OSFY* so that they can reach a wider audience. Your tips could be related to administration, programming, troubleshooting or general tweaking. Submit them at www.opensourceforu.com. The sender of each published tip will get a T-shirt.
