

How to get Ubuntu to boot before Windows

When you choose the option to install Ubuntu alongside Windows, the expected result is that on booting the computer, a menu will appear with options to boot either Ubuntu or Windows.

Sometimes, things do not go as planned and Windows boots first without any option appearing for starting Ubuntu.

To fix the bootloader within Ubuntu, just follow the steps shown below.

Step 1: Insert your live Ubuntu USB drive into the computer.

Step 2: Open a terminal window and type the following command:

```
$sudo apt-get-install efibootmgr
```

Enter your password and press Y when asked whether you want to continue.

A list will appear with the following information:

```
BootCurrent: 0001
Timeout: 0
Bootorder: 0001, 0002, 0003
Boot 0001 Windows
Boot 0002 Ubuntu
Boot 0003 EFI USB Drive
```

This list is only indicative of what you might see. BootCurrent shows the item that is currently booting and you will notice that in the list above, Ubuntu appears after Windows.

You can change the boot order using the following command:

```
$sudo efibootmgr -o 0002,0001,0003
```

This will change the boot order so that Ubuntu comes first, followed by Windows and then the USB drive.

Exit the terminal window and reboot your computer (remember to remove your USB drive). The menu that now appears should have the option to boot Ubuntu or Windows.

Counting the number of files of a specific type

You can count the number of files of a specific type in a given directory using the *ls*, *grep* and *wc* commands. All these commands can be written in one line with the help of piping, as follows:

```
$ ls -l | grep ^- | wc -l
```

In the above command, *grep* is used to search according to a given pattern or regular expression, and *wc* is used to count the lines, words and characters.

Creating 'New Document' as a right click option in Ubuntu

You can enable 'New Document' as a right click option in Ubuntu 17.10 and 18.04 in two ways (using the GUI or the terminal). But before doing that, check if you have a folder named 'Templates' under *Home*; if not, create it.

Using the GUI: Press the super key (win key), search for the text editor and open it. Then, save the new document in the *Templates* folder with a name like 'New Document'.

Using the command line: From the command line, use the following code:
