

Jib can integrate with the Java build and access the information required to package the application. Contributors said that the tool can organise an application into distinct layers and rebuild only the changed layers. Additionally, it can allow developers to use declarative language and build container images.

CryptoKitties stays with Ethereum and goes open source

The popularity of CryptoKitties has also led to accusations of rising transaction fees on the network and serious backlogs, leading to questions on how the firm plans to solve these issues.

There have been several changes and new initiatives announced by Ethereum-based DApp projects, and CryptoKitties is to further decentralise the premium virtual feline offering. The Internet-based game for breeding, buying and selling of charming digital kittens, which runs atop Ethereum, has acquired a large, mainstream audience. It has also raised questions about whether the project really operates in a truly decentralised manner.

For instance, it is possible for Kitty Core, the owner of the CryptoKitties project, to edit the underlying algorithm and mutate a popular or high-worth digital kitten despite objections from the kitten's owner. Essentially, the project runs in a centralised manner, with the project owner having the utmost power.

In response to public demand, the CryptoKitties project has initiated a move towards loosening controls on its programming code to fall in line with the expected ethics of cryptocurrency networks and achieve true decentralisation.

However, a key benefit of centralisation is that it allows its output to be used in an easy, well-defined manner, while decentralisation usually leads to complications. The value of crypto collectables is dependent upon their uniqueness and rarity, and a fine balance needs to be maintained between owners' rights, the available monetary benefits and their distribution. To strike a balance between usability and decentralisation, CryptoKitties has announced a series of updates.

Users may delete their accounts and can now take their digital assets off the platform. Earlier, they would lose control of their assets upon account deletion. Even if users want to create a new alternative version of CryptoKitties, they will not be open to legal challenges.

It's as much about removing the firm's top officials as a central authority as it is about doing so in a way that doesn't compromise the value of this game, of this product and of this platform, as a whole.

CryptoKitties has also announced another key initiative called the Nifty Kitty Program, which offers options to independent teams of developers to apply for loans or grants and finance their work for the community. This is expected to keep the funding sustainable and the project agile enough to run smoothly while allowing the developer community to benefit from their contributions.

New security solution for containers from Trend Micro

In India, there are a lot of activities happening around the cloud and container related technologies. These continue to be a strong growth driver. In order to ensure that this growth is not hindered, Trend Micro has announced the expansion of its security solution for containers with Deep Security Smart Check. The malware and vulnerabilities are spotted efficiently with this solution, making it easy to spot and rectify the security issues in the system.

Deep Security Smart Check identifies security issues prior to deployment with container image scanning. The system provides solutions for automated protection across containers and the host, securing the host from container breaches throughout the continuous delivery pipeline, from design to runtime.

An extensive new suite of APIs and an automation centre with resources to help enable security automation through better integrations are also being developed to upgrade the existing standards of solutions.

Organisations are increasingly shifting their workloads into hybrid cloud services and Smart Check supports the DevOps (development operations) demands to continuously build, secure and ship fast, as well as run anywhere. A key to increasing security for applications starts with building security into the continuous integration and development (CI/CD) pipeline.
