

backing up, recovering, migrating and indexing of all their data, irrespective of whether it is on-premise or in the cloud.

The partnership will allow the availability of Commvault software as a solution as well as a managed service. Customers can deploy the software on-premise, on infrastructure managed in IBM data centres or in cloud environments. These offerings can help healthcare customers to manage critical medical data, Epic and other EHR (electronic health record) data, as well as medical images, across their healthcare enterprises.

The partnership aims at providing enterprises a simple and comprehensive data protection and management platform. It intends to reduce complexity in IT environments and enable digital transformation.

The partnership may empower customers with ways to maintain business continuity, streamline IT efforts and minimise cyber security and regulatory compliance risks. The integration of IBM and Commvault solutions for on-site or off-site data backup may eventually lead to a simplified business continuity model.

CaaS platform to accelerate deployment of container based applications

To deliver Kubernetes innovations in a complete enterprise-class container management solution and accelerate delivery of modern applications for the digital economy, SUSE has launched SUSE CaaS (Container as a Service) Platform 3.

The platform provides new support for more efficient and secure container image management, and simplifies the deployment and management of long-running workloads. With deep competencies in infrastructure, systems,

process integration, platform security, life cycle management and enterprise-grade support, it ensures IT operations teams can deliver the power of Kubernetes to their users quickly, securely and efficiently.

The CaaS platform allows the customer to optimise cluster configuration with expanded data centre integration and cluster reconfiguration options. Setting up a Kubernetes environment is simplified with improved integration of private and public cloud storage, and automatic deployment of the Kubernetes software load balancer. It has a new toolchain module, which allows customers to tune the MicroOS container operating system to support customised configuration. With the new cluster reconfiguration capabilities, a user can transform a startup cluster into a scalable and highly available environment.
