

Q What is hyper-convergence? Why is it a necessity in India now?

Hyper-converged infrastructure is a software defined format of consuming IT infrastructure. Most IT departments in enterprises are struggling to keep up with the needs of today's businesses – for speed and efficiency. This includes ways of figuring out how to make apps run faster, make provisioning simpler, and offer non-disruptive and quick scaling – all economically. Traditional infrastructure and prevailing processes can no longer meet the requirements and new demands of the next-generation data centre. Hyper-converged infrastructure (HCI) is able to solve this problem.

Q Who are the essential customers of hyper-convergence in the country?

There are no limits to who can benefit from using hyper-convergence. We are currently seeing multiple user groups utilising HCI in their ecosystem. These include those in charge of data centre operations, software developers and analysts, IT service providers, enterprises with limited IT skills and offices in remote areas.

Q Why should these customers invest in this technology?

Customers across all industries can benefit from the adoption of converged systems. Organisations, both large and small, from all industries, striving to modernise their infrastructure in order to compete in today's digital age, will benefit from an integrated system and converged infrastructure environment.

A hyper-converged infrastructure helps customers in building, maintaining and expanding their IT infrastructure, which is otherwise risky, wastes time and resources, while making predictable scaling

difficult. Managing the life cycle of the infrastructure becomes easier, a task that's otherwise complicated by multiple upgrades. Dealing with many support organisations is hard and takes too long.

Hyper-converged infrastructure is now being preferred for perimeter workloads, which are non-core for the business. It is also used extensively in organisations that have high scale-out requirements. With scalability and simplicity as the key parameters for customers in India, HCI appliances are a perfect fit for businesses looking to move from a 'build yourself' to a 'buy' model.

Q What role does hyper-convergence has for IoT and open source software?

India is going through a digital revolution and the government is promoting organisations that want to test and deploy open source solutions. In fact, many government entities are adopting open source to a very large extent. Hyper-convergence allows seamless deployment and testing of open source applications.

Today, many IoT systems are being developed with open source software that use hyper-convergence for ease of deployment and testing. A considerable number of organisations in IT and IT enabled services are using the benefits of HCI for the said purpose.

Q Where does India stand in terms of adopting hyper-convergence technology?

India is one of the forerunners in adopting new technologies like hyper-convergence. Indian firms have already seen the benefits of hyper-convergence for their customers and have begun adopting it on a large scale.

Unlike in any other region, there are less legacy systems in India. There are customers who are keen
