

single factory, which we have jointly achieved. Thus, our customers can experience seamless support in all spheres from a particular vendor. Otherwise, issues may creep in, particularly with regard to support and management.

Q What is the market size of hyper-convergence in India and across the world?

As per analysts' views, the size of the generic Indian hyper-convergence market is about ₹ 35 million to ₹ 40 million at present. Because of its rapid year-on-year growth, at the rate of 46 to 50 per cent, the market is expected to reach ₹ 63 to 65 million by 2019 in India alone. Globally, the hyper-convergence market is US\$ 3.5 billion and is expected to touch about US\$ 5 billion at the end of 2019, with a year-on-year growth rate of 42 to 45 per cent. Dell EMC's hyper-convergence market share is 41 per cent in India and 43 per cent globally.

Q What are the challenges that you have faced in your hyper-convergence journey?

Old technology walking hand in hand with hyper-convergence technology is a concern now. While hyper-convergence is only three to four years old, other legacy software that it operates with has been running for so many more years. Many customers are still in the phase of migrating from traditional technology to hyper-convergence, and we have a lot to do in terms of changing their mindsets.

Also, it is a challenge for customers if they have already made heavy investments on older technology but are now looking to shift to hyper-convergence. Customers also raise concerns about everything being provided by a single entity, as their dependence on that vendor becomes very high. However, we ensure the right kind of support and documentation to customers to enable them to continue on a seamless hyper-convergence journey.

Q Are there any areas in hyper-convergence which are yet to be explored?

Currently, we have only explored the tip of the iceberg. Once this technology stabilises and the customers experience other services that it has to offer, we are looking forward to making software completely automated in the future, with the help of hyper-convergence. However, to achieve this, the technology has to mature to a greater extent.

Customers are also exploring the option of operating across two worlds – the private and the public cloud, such that they get a unified view of both and are able to move workloads from their own, private environment to the public one, and vice versa. This is known as the hybrid cloud, and has just started to happen. It has immense potential to provide customers with a seamless experience of moving between the public and private cloud. Intermediary software are being developed, using which customers can move between the public and private clouds.

Q Who are the customers of Dell EMC's hyper-convergence solutions?

Starting from finance and manufacturing, to IT and ITes, telecom and government, we have several small and large companies as customers in India. Kotak Bank, Net Magic Telecom, Infosys, Disney, Accenture, KPIT, Harley Davidson are our major Indian customers.

Manufacturing and retail outlets like Mohan Clothing (Blackberry formal wear), publishing houses like Penguin Random House, educational institutes, smaller financial institutes like Mirae Asser, smaller government offices like WEBEL, and IT/IT enabled services like TASEC are our other smaller customers for hyper-convergence in India. **END** 🐧
