

Platform independent: Master Password is capable of running on multiple platforms, such as from the command line, as a mobile app and a Web version, so it really doesn't matter if you have a new device that does not have the Master Password app on it. You can still use the app from one of the above platforms.

The disadvantages of the Master Password app

There's no such thing as a foolproof system, and when it comes to privacy, the most secure system may still cause a lot of inconvenience to the user. Here are some of the hassles encountered when using this app.

Changing may involve a lot of work: When you change the master password in the app, you're going to have to change all the accounts' passwords, because your master password is one of the key ingredients in generating passwords. So if you're introducing any changes in any one of the major components, all your passwords need to be changed too.

You cannot customise a password template: Sometimes you may want to set up a password using a particular template, because of a certain level of comfort you feel in using that template or because of certain password policies you have to abide by in order to use the service.

This has been discouraged in the Master Password app to reduce the burden on the user side, because in the event of any failure or any loss of data, you may not remember the password template you've set for a particular site. The situation may get worse if you use more than one customised password template for various sites.

Only one factor: The Master Password app strictly uses only one factor, that is, the master password. If intruders get to know the master password, it is only a matter of time before they access the passwords to your accounts because the rest of the details about you can be looked up on the Internet. It is, therefore, imperative that you give a strong master password and do not reveal it to others.

However, the disadvantages of the Master Password app do not overshadow all the good things that this app has to offer. **END** 🐧
