

SUSE and EQT partner to drive growth

SUSE has announced plans to partner with growth investor, EQT, to continue its momentum, strategy execution and product expansion as an independent business.

This partnering of SUSE with EQT (from Micro Focus) is subject to approval by both Micro Focus shareholders and customary regulatory authorities, which is expected to occur in early 2019. While partnering with EQT, SUSE is expected to make use of market opportunities both in the Linux operating system area as well as in emerging product groups in the open source space.

CEO Nils Brauckmann stated that SUSE will move to the next stage of its corporate evolution and operate globally as an independent company, after the completion of the transaction. The company expects staffing, customer relationships, partnerships, product and service offerings, commitment to open source leadership, and support for the key open source communities to remain unchanged.

SUSE has grown as a business that cemented its position as a provider of enterprise-grade, open source software-defined infrastructure and an application delivery solutions provider. The company expects to further realise its potential with backing from EQT to fuel its momentum and build on the progress made.

The company believes the partnership is well timed as the market-driven needs for digital transformation, open source software-defined infrastructure (SDI) and application delivery technologies are increasing. The partners are moving ahead towards open source technologies and solutions to transform their businesses.

AT&T acquires AlienVault to expand its cyber security solutions portfolio

AT&T has acquired cyber security firm AlienVault. The acquired firm uses open source software to provide threat-intelligence. This can help AT&T to expand its security solutions portfolio, and eventually allow the incorporation of threat intelligence into response capabilities, providing intelligent security for business customers.

Mozilla's upcoming browser is based on open source components

It has been reported that Mozilla may be working on 'Fenix', an Internet browser for the Android operating system. It is anticipated that the browser will be targeting a younger and more tech-savvy audience.

The company is the maker of Firefox, one of the alternate browsers for Android devices. Presently, Firefox for Android has entered the maintenance phase. This implies that there will not be many upcoming updates except bug fixes and security updates.

The Fenix browser is said to be based on the open source Android Components, which is a collection of Android libraries for the development of browsers or browser-like applications. According to GitHub's version history overview, developers started working on the upcoming browser in June 2018.

The reasons for developing the Android browser and its commercialisation plans have not been disclosed by the company yet. Currently, the open source software community has three different Android browsers—Firefox Browser, Firefox Focus and Firefox Nightly.

Fenix will be an addition to the community's browsers for Android devices. While most of the Firefox updates have been put on hold, contributors are working on developing this browser.
