

Q What are the recent trends vis-à-vis the role and scope of bots in India?

Chatbots are the current flavour globally. A report by Gartner has estimated that by 2019, 40 per cent of enterprises will be actively using chatbots to facilitate business processes using natural language interactions.

In India, the proliferation of smartphones, as well as the growth in broadband connectivity and messaging apps, is increasing the demand for chatbots. Enterprises are looking to connect with their customers, partners and employees in new and different ways. We're currently witnessing increased demand from banks, insurance firms and travel companies, amongst others. In the coming months, we expect bots to play a key role in other sectors as well, such as healthcare and government services.

Q What is the future of AI and chatbots in the Indian market?

According to a recent report, the global chatbot market is expected to reach a turnover of US\$ 1.23 billion by 2025, which represents a CAGR of 24.3 per cent. In India, chatbot adoption is growing faster than most of the other APAC countries. With more AI getting embedded in chatbots, it's only a matter of time before businesses adopt chatbots as a revenue generation engine. Just to give you an indication of the potential and scope in this field, in the last few months, AI and chatbots have featured in almost all my discussions with customers across industries.

Q What features of chatbots most excite the tech decision makers among enterprise customers?

There are various features that influence the decision to use chatbots. But the major differentiators or factors considered are:

- Time to market – How easy and quickly can you go live?
- How robust is the engine? Can it handle a variety of languages? Can

it connect to a variety of channels and messaging protocols?

- How good are the product's AI/ML capabilities, e.g., what is the F-score of the bot?

Q A 'one size fits all' approach might not be the best for chatbots. What are your views on this? Can you share any use cases?

At Oracle, we understand that different companies have different requirements; so we bring in AI algorithms for deep learning, cognitive services, dialogue and context, and knowledge services, which we then fine tune for chatbots. With AI powered chatbots, organisations can finally deliver convenience and personalisation that customers prefer. Customers are increasingly noticing the difference between companies that have true AI-powered learning apps and those that don't.

“
In India, chatbot adoption is growing faster than most of the other APAC countries.
”

Another crucial factor is how quickly these bots can be built. Mature chatbot platforms such as Oracle's enable the creation of chatbots with minimal coding.

Bajaj Electricals, one of our India based customers, took just three weeks to build its pilot chatbot using Oracle's intelligent bots, which are part of the Oracle Mobile Cloud Enterprise. The company is now in the process of executing a soft launch of its first customer service/support chatbot.

Q What role is Oracle playing in the chatbot space?

Oracle's new bot-building capability, part of Oracle Mobile Cloud Enterprise, lets enterprises create new interactive customer experiences using drag-and-drop tools. Developers define how the conversation should flow, what kind
