

Top Ten Android Smartphones and Tablets

It is a bit difficult to choose a smartphone today, as there is a bewildering variety of phones in the market. This article will help the reader make an intelligent choice.

Android is a mobile operating system designed and developed by Google (initially developed by Android Inc.), basically for touchscreen mobile devices such as smartphones and tablets. There are multiple Android operating systems available, the latest version being Android 8 Oreo. The Android operating system is written in Java, C and C++. It is also available as Android TV for televisions, Android Auto for cars, and Android Wear for wrist watches.

The basic features available in Android devices are shown in Figure 2.

Main characteristics of a smartphone or a tablet

There are many questions a potential buyer asks a dealer before purchasing a smartphone or a tablet. It is worth

discussing the main features that one should check before deciding on a particular device.

Display size and resolution: Display has two dimensions – size and resolution. If you are a regular user, you need a smartphone for checking emails, as well as chatting and browsing social media; in which case, anything from a 12.7cm to 13.9cm (5-inch to a 5.5-inch) HD, or full-HD display handsets are perfect for you. Otherwise, you can opt for a tablet.

Processing power: What the heart does for a human, the processor does for Android devices. The processing power of a device varies from one device to another, depending on several factors such as the OS version, UI, bloatware and more.

Camera – capturing moments: Most users want to know how many

megapixels the camera has. But just having a higher number of megapixels does not mean that the camera is better. Several other specifications, such as
