

Open source to be an essential part of university curriculum worldwide

Red Hat has established a partnership with more than 100 colleges and universities all over the globe to provide enhanced training in open source. As part of the partnership, Red Hat will also provide certifications in upcoming technologies like DevOps, cloud IT automation and many others.

To name a few, Maharaja Ranjit Singh Punjab Technical University and Amity University have recently included a systems administration curriculum in their updated engineering syllabus. In line with recent developments in the field of open source in India, Red Hat India has recently signed a Memorandum of Understanding with Telangana Academy for Skills and Knowledge (TASK), the Department of ITE&C, government of Telangana.

Red Hat Academy's core curriculum comprises systems administration and systems engineering on Red Hat Enterprise Linux, besides Red Hat JBoss middleware administration. For cloud IT automation, the curriculum includes introductory Red Hat OpenStack (cloud) content and technical training to the associated faculty members.

The courses are global and have been incorporated in colleges at 35 locations across North America and 85 locations worldwide. The instructors are selected based on their Red Hat certifications, and their knowledge of the course's curriculum.

FB strengthens its commitment for open source with Docusaurus

As part of its commitment to the open source community, Facebook has unveiled Docusaurus, which is an open source toolkit that lets users and teams publish documentation websites without having to worry about the infrastructure and design details.

Sources claim that Docusaurus is an easy-to-maintain open source documentation tool that uses Markdown to help users write docs and blog posts. The primary function of Docusaurus is to publish a set of static HTML files that are ready to upload onto a server for public viewing.

Banking upon open source, Docusaurus enables developers to customise their project's layout, reusing the same header and footer. For those not that familiar with the technology, this feature has many developers praising it. "The easiest React static site generators. Unlike Gatsby and Next, there is no need to fiddle with any real code/complicated API just to get a Markdown blog working," says one user.

Docusaurus comes with a couple of other very useful perks as well. There's localisation that comes preconfigured with support for over 70 languages. There's also versioning support, and document search, so that you can easily trace the document you wish to update or consult.

This is not the first time Facebook has released toolkits and products to the open source community for further development and broader adoption.

LEDE and OpenWRT promise a joint release soon

It all started in March 2016, when a group of developers, unhappy with where OpenWRT was heading, created LEDE or the Linux Embedded Development Environment. The group created the alternative LEDE since the concern was that OpenWRT lacked a process to bring new core developers into the project at a time developer numbers were dwindling.

At the end of 2016, the two groups started discussing merging again, and in May 2017, they reached an agreement on the terms of a merger. The OpenWRT and LEDE open source router projects have now merged and a major release is due in the coming months.

OpenWRT has been known as a serious open source codebase for router firmware. It allows users to overwrite vendor firmware, either for security reasons or to conduct their own low level development.

At the time of the split, LEDE was led by Jo-Philipp Wich, John Crispin, Daniel Golle, Felix Fietkau, Hauke Mehrtens, Matthias Schiffer and Steven Barth.

The OpenWRT - LEDE merged open source router project has now gone live. The announcement says the project will be governed under the rules of the LEDE project, and that the focus will be on small, frequent minor releases, as well as stability and release maintenance.
