

```

- copy:
  src: ../../files/ssl-params.conf
  dest: /etc/nginx/snippets/ssl-params.conf
  owner: root
  group: root
  mode: 0644

- copy:
  src: ../../files/google.com
  dest: /etc/nginx/sites-enabled/google.com
  owner: root
  group: root
  mode: 0644

- name: Restart nginx
  service:
    name: nginx
    state: restarted

- wait_for:
  port: 443

```

The above playbook can be executed as follows:

```
$ ansible-playbook -i inventory/kvm/inventory playbooks/
configuration/nginx-ssl.yml --tags https -K
```

You can now open <https://192.168.122.244> in a browser on the host system, and view the self-signed certificate as shown in Figure 2.

After accepting the certificate, you will be able to see the default Nginx home page as shown in Figure 3.

You can also use the `curl` command to view the home page from the command line, as follows:

```
$ curl https://192.168.122.244 -k
<!DOCTYPE html>
<html>
<head>
<title>Welcome to nginx!</title>
<style>
  body {
    width: 35em;
    margin: 0 auto;
    font-family: Tahoma, Verdana, Arial, sans-serif;
  }
</style>
</head>
<body>
<h1>Welcome to nginx!</h1>
<p>If you see this page, the nginx web server is successfully
installed and
working. Further configuration is required.</p>
```

```

```
<p><em>Thank you for using nginx.</em></p>
</body>
</html>

```

Validation

You can run a number of validation checks on the SSL certificate, periodically, to ascertain that it still holds good and meets your requirements. A few examples of sanity checks that you can perform on the certificate are shown below for reference:

```

- name: Validate SSL certificate
  hosts: ubuntu
  become: yes
  become_method: sudo
  gather_facts: true
  tags: [validate]

```
