

Automate File Classification with this Python Program

Unclutter your *Downloads* folder in Windows with this extremely useful file classifier which is written in Python. After running this script, you will be able to manage your downloads with ease.

Internet users download several files to the *Downloads* folder of Windows OS. If you examine the contents of your *Downloads* folder (`C:\Users\<user-name>\Downloads`) you might find various files in diverse formats like MP3, PDF, docs, srt, Zip, MP4, etc. These files populate your C drive, and then you start moving the files from the *Downloads* folder to other folders, which can be a very tiresome and monotonous task.

In this article, I am going to show you how to shift your files from the *Downloads* folder to their respective folders automatically, by using a simple Python program.

The structure of the program

The complete program contains a Python code and one *txt* file. The *txt* file supplies the necessary parameters and rules for moving the files.

First, let's write a text file called *rules.txt*, as shown below:

```
C:\Users\<user-name>\Downloads
R
mp3:D:\music
pdf:D:\all_pdf
exe:D:\software
doc:D:\all_docs
docx:D:\all_docs
srt:D:\all_srts
mp4:D:\all_mp4
```

The first line indicates the complete path of the *Downloads* folder; so it is user-specific. The second line states the mode. I used 'R' for recursive mode and 'S' for simple mode. In recursive mode, the interpreter checks folders inside *Downloads*. In simple mode, the interpreter checks the files only in the *Downloads* folder.

The remaining lines show the file

extensions with paths. This means that MP3 files must be moved to *D:\music* folder and so on.

Let us look at the program *class1.py*, and try and understand it:

```
# program created by mohit
# official website L4wisdom.com
# email-id mohitraj.cs@gmail.com
```

Import the mandatory files:

```
import os
import shutil
```

The following lines indicate the path of the *rules.txt* file. In your Windows folder, this should be `C:\Users\<user-name>\.`

```
file_path= os.path.expanduser('~')
file_name = file_path+"\\*.*rules.txt"
```
