

Canonical and Rancher Labs announce Kubernetes cloud native platform

Canonical, in partnership with Rancher Labs, has announced a turnkey application delivery platform built on Ubuntu, Kubernetes and Rancher 2.0. The new cloud native platform will make it easy for users to deploy, manage and operate containers on Kubernetes through a single workflow management portal—from development-and-testing to production environments. Built on Canonical's distribution of Kubernetes and Rancher 2.0, the cloud native platform will simplify enterprise usage of Kubernetes with seamless user management, access control and cluster administration.

"Our partnership with Rancher provides end-to-end workflow automation for the enterprise development and operations team on Canonical's distribution of Kubernetes," said Mark Shuttleworth, CEO of Canonical. "Ubuntu has long been the platform of choice for developers driving innovation with containers. Canonical's Kubernetes offerings include consulting, integration and fully-managed Kubernetes services on-premises and on-cloud," Shuttleworth added.

with the additions brought about by GNOME 3.26 to Fedora 27 Workstation, making it easier to build applications and improving the overall desktop experience," said Matthew Miller, a Fedora project leader.

Canon joins the Open Invention Network community

Open Invention Network (OIN), the largest patent non-aggression community in history, has announced that Canon has joined as a community member. As a global leader in such fields as professional and consumer imaging and printing systems and solutions, and having expanded its medical and industrial equipment businesses, Canon is demonstrating its commitment to open source software as an enabler of innovation across a wide spectrum of industries.

"Open source technology, especially Linux, has led to profound increases in capabilities across a number of key industries, while increasing overall product and service efficiency," said Hideki Sanatake, an executive officer, as well as deputy group executive of corporate intellectual properties and legal headquarters at Canon. "By joining Open Invention Network, we are demonstrating our continued commitment to innovation, and supporting it with patent non-aggression in Linux."

OIN's community practices patent non-aggression in core Linux and adjacent open source technologies by cross-licensing Linux System patents to one another on a royalty-free basis.

GTech partners with Red Hat to catalyse open source adoption in Kerala

The Kerala government's IT policy encourages the adoption of open source and open technologies in the public domain. Hence, the Group of Technology Companies (GTech), the industry body for IT companies in Kerala, has recently signed an MoU with Red Hat.

The partnership aims to create enhanced awareness on various open source technologies amongst IT professionals in the state. The MoU will facilitate partnerships between Red Hat and GTech member companies. The efforts will focus on research and product development in open source software technologies.

The state government has also emphasised the need to promote open source among SMEs. According to the terms of the MoU, Red Hat will organise events in IT parks across the state. These events were kickstarted in November 2017, and include lectures, seminars and presentations spanning the Internet of Things (IoT), artificial intelligence, analytics, development tools, content management systems, desktop publishing and other connected topics.

Amazon extends support to Facebook and Microsoft

Amazon has announced its ONNX-MXNet Python package to import Open Neural Network Exchange (ONNX) deep learning models into Apache MXNet. This move indicates the company's support for Facebook and Microsoft in their efforts to open source artificial intelligence (AI).

With this package, developers running models based on open source ONNX will be able to run them on Apache MXNet. Basically, this allows AI developers to keep models but switch networks, as opposed to starting from scratch.
