

- POP: *pop-mail.outlook.com*
- SMTP: *smtp-mail.outlook.com*
- Gmail
 - POP: *pop.gmail.com*
 - SMTP: *smtp.gmail.com*

▪ Yahoo

- POP: *pop.mail.yahoo.com*
- SMTP: *smtp.mail.yahoo.com*

The following settings are common for them:

- POP
 - Connection security/Encryption method: SSL
 - Port: 995
- SMTP
 - Connection security/Encryption method: SSL/TLS/STARTTLS
 - Port: 465/587

Some ISPs and hosting providers provide unencrypted mail access. Here, the connection security method will be 'None', and the ports are set to 110 for POP and 25 for SMTP. However, please be aware that most ISPs block Port 25, and many mail servers block mail originating from that port.

Thunderbird and SeaMonkey

Popular email clients today are Microsoft Outlook and Mozilla Thunderbird, the latter being the obvious FOSS option. Like the browser Firefox, Thunderbird is modern software and supports many extensions or add-ons. Unlike Outlook (which uses Microsoft Word as the HTML formatting engine), Thunderbird has better CSS support as it renders HTML messages using the Gecko engine (like the Firefox browser).

The SeaMonkey Internet suite bundles both the Firefox browser and Thunderbird mail clients, in addition to an IRC client and a Web page designer. SeaMonkey is based on the philosophy of the old NetScape Internet Communication Suite, in which the browser was known as Netscape Navigator and the mail client was known as Netscape Communicator. Because of certain trademark objections with Mozilla, some GNU/Linux distributions were bundling Firefox and Thunderbird as IceWeasel and IceDove. SeaMonkey became IceApe. This was resolved in 2016.

If you have already opened the SeaMonkey browser, then the SeaMonkey mail client can be opened in a flash, and the reverse is also true. This is very useful because website links in the SeaMonkey mails are opened in the SeaMonkey browser. Firefox is a separate application from Thunderbird and does not have the same advantage. For this reason, I use SeaMonkey instead of Thunderbird. SeaMonkey is available at <https://www.seamonkey-project.org/>.

By default, SeaMonkey looks like Firefox or Thunderbird. I prefer to change its appearance using the Modern theme, as it makes it look like the old Netscape 6, and also because I need the browser to look different from regular Firefox. To enable this theme, go to **Tools » Add-Ons » Appearance » Seamonkey Modern**.

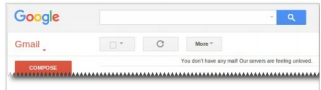

Figure 1: Live off the grid with no mail online. To get this Gmail note, you will have to empty the Inbox and Trash, and also delete all archived messages.

Even on a desktop screen, space may be at a premium. Currently, Thunderbird and SeaMonkey do not provide an easy way to customise the date columns. I use this trick in the launcher command to fix it.

```
export LC_TIME=en_DK.UTF-8 && seamonkey -mail
```

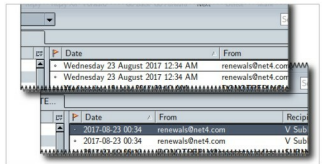

Figure 2: Changing the format of the date columns requires a hack

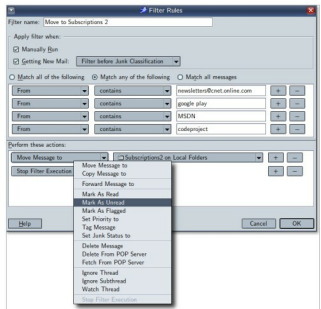

Figure 3: Configure your own mail filters

Email providers today do a good job of filtering junk mail. You can do a better job with your own mail filters (**Tools » Message Filters**). You can choose to move/delete messages based on the occurrences of certain words in the **From**, **To** or **Subject** headers of the email.
