

Figure 1: Ping simulation demo

### 5 directories, 19 files

To install Cloonix, run the following commands, which will install all the packages required, except Wireshark.

```
$cd $HOME/cloonix
$sudo ./install_depends build
```

The following command will install and configure Cloonix in your system:

```
$sudo ./doinstall
```

The command given below will install Wireshark:

```
$sudo apt-get install wireshark
```

You have to download VMs in `$HOME/cloonix_data/bulk`, as shown below:

```
bulk
├── batman.qcow2
├── bind9.qcow2
├── centos-7.qcow2
├── coreos.qcow2
├── ethernet.qcow2
├── jessie.qcow2
├── mpls.qcow2
├── stretch.qcow2
└── zesty.qcow2
```

To simulate the networks, you can download the ready-to-demo scripts available in [http://cloonix.fr/demo\\_stored/v-37-01/cloonix\\_demo\\_all.tar.gz](http://cloonix.fr/demo_stored/v-37-01/cloonix_demo_all.tar.gz).

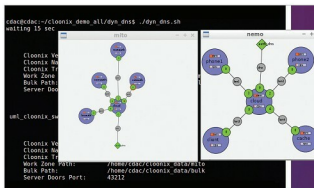

Figure 2: Dynamic DNS demo

Shown below are the demo scripts available:

```
└─ batman
└─ cisco
└─ dns
└─ dyn_dns
└─ eap_802_1x
└─ ethernet
└─ fwmark2mpls
└─ mpls
└─ mplsflow
└─ netem
└─ ntp
└─ olsr
└─ openvswitch
└─ ospf
└─ ping
└─ strongswan
└─ unix2inet
```

To run any demo for ping, for instance, just go to the `ping` directory and run the following code:

```
./ping.sh
```

This will create all the required VM(s) and network components. You can also monitor traffic by using Wireshark.

Cloonix is a good tool to run network simulation. All the VMs are basically Linux system administration, mobile forensics and Big Data.
