

- Industry standard open source support and data formats
- Low cost of ownership

Bareos (Backup Archiving Recovery Open Sourced)

Bareos offers high data security and reliability along with cross-network open source software for backups. Now being actively developed, it emerged from the Bacula Project in 2010.

Bareos supports Linux/UNIX, Mac and Windows based OS platforms, along with both a Web GUI and CLI.

Clonezilla

Clonezilla is a partition and disk imaging/cloning program. It is similar to many variants available in the market like Norton Ghost and True Image. It has features like bare metal backup recovery, and supports massive cloning with high efficiency in multi-cluster node environments.

Clonezilla comes in two variants—Clonezilla Live and Clonezilla SE (Server Edition). Clonezilla Live is suitable for single machine backup and restore, and Clonezilla SE for massive deployment. The latter can clone many (40 plus) computers simultaneously.

Duplicati

Designed to be used in a cloud computing environment, Duplicati is a client application for creating encrypted, incremental, compressed backups to be stored on a server.

It works with public clouds like Amazon, Google Drive and Rackspace, as well as private clouds and networked file servers. Operating systems that it is compatible with include Windows, Linux and Mac OS X.

FOG

Like Clonezilla, FOG is a disk imaging and cloning tool that can aid with both backup and deployment. It's easy to use, supports networks of all sizes, and includes other features like virus scanning, memory testing, disk wiping, disk testing and file recovery. Operating systems compatible with it include Linux and Windows.
