

Use These Python Based Tools for Secured Backup and Recovery of Data

Python, the versatile programming environment, has a variety of uses. This article will familiarise the reader with a few Python based tools that can be used for secured backup and recovery of data.

We keep data on portable hard disks, memory cards, USB Flash drives or other such similar media. Ensuring the long term preservation of this data with timely backup is very important. Many times, these memory drives get corrupted because of malicious programs or viruses; so they should be protected by using secure backup and recovery tools.

Popular tools for secured backup and recovery

For secured backup and recovery of data, it is always preferable to use performance-aware software tools and technologies, which can protect the data against any malicious or unauthenticated access. A few free and open source software tools which can be used for secured backup and recovery of data in multiple formats are: AMANDA, Bacula, Barcos, CloneZilla, Fog, Rsync, BURP, Duplicata, BackupPC, Mondo Rescue, GRSync, Areca Backup, etc.

Python as a high performance programming environment

Python is a widely used programming environment for almost every application domain including Big Data analytics, wireless networks, cloud computing, the Internet of Things (IoT), security tools, parallel computing, machine learning, knowledge discovery, deep learning, NoSQL databases and

many others. Python is a free and open source programming language which is equipped with in-built features of system programming, a high level programming environment and network compatibility. In addition, the interfacing of Python can be done with any channel, whether it is live streaming on social media or in real-time via satellite. A number of other programming languages have been developed, which have been influenced by Python. These languages include Boo, Cobra, Go, Goovy, Julia, OCaml, Swift, ECMAScript and CoffeeScript. There are other programming environments with the base code and programming paradigm of Python under development.

Python is rich in maintaining the repository of packages for big applications and domains including image processing, text mining, systems administration, Web scraping, Big Data analysis, database applications, automation tools, networking, video processing, satellite imaging, multimedia and many others.

Python Package Index (PyPi): <https://pypi.python.org/pypi>

The Python Package Index (PyPi), which is also known as Cheese Shop, is the repository of Python packages for different software modules and plugins developed as add-ons to Python. Till September 2017, there were more
