

Juniper Networks reinforces longstanding commitment to open source

During the recently organised annual NXTWORK user conference, Juniper Networks announced its intent to move the code base of OpenContrail, an

open source network virtualisation platform for the cloud, to the Linux Foundation. OpenContrail is a scalable, network virtualisation control plane. It provides both feature-rich software-defined networking (SDN) and strong security.

Juniper first open sourced its Contrail products in 2013, and

built a vibrant user and developer community around this project. In early 2017, expanded the project's governance, creating an even more open, community-led effort to strengthen the project for its next growth phase.

Adding its code base to the Linux Foundation's networking projects will further Juniper's objective to grow the use of open source platforms in cloud ecosystems. OpenContrail has been deployed by various organisations, including cloud providers, telecom operators and enterprises, to simplify operational complexities and automate workload management across diverse cloud environments, including multi-clouds.

Arpit Joshipura, vice president of networking and orchestration at the Linux Foundation said, "We are excited at the prospect of our growing global community being able to broadly adopt, manage and integrate OpenContrail's code base to manage and secure diverse cloud environments. Having this addition to our open source projects will be instrumental in achieving the level of technology advancements our community has become known for."

Once the Linux Foundation takes over the governance of OpenContrail's code base, Juniper's mission to ensure the project truly remains community-led will be fulfilled. As a result, this will accelerate pioneering advances and community adoption, as well as enable easier and secure migration to multi-cloud environments.

GIMP 2.9.8 image editor now comes with better PSD support and on-canvas gradient editing

The latest release of the GIMP, the popular open source image editor, introduces on-canvas gradient editing and various other enhancements while focusing on bug-fixing and stability. You can now create and delete colour stops, select and shift them, assign colours to colour stops, change blending and colouring for segments between colour stops, etc, from mid-points.

"Now, when you try to change an existing gradient from a system folder, the GIMP will create a copy of it, call it a 'custom gradient' and preserve it across sessions. Unless, of course, you edit another 'system' gradient, in which case it

Heptio and Microsoft join the effort to bring Heptio Ark to Azure

The new collaboration between Heptio and Microsoft aims to ensure Heptio Ark delivers a strong Kubernetes disaster-recovery solution for customers who want to use it on Azure. The companies will also work together to make the Ark project an efficient solution to move Kubernetes applications across on-premise computing environments and Azure, and to ensure that Azure-hosted backups are secure.

The Ark project provides a simple, configurable and operationally robust way to back up and restore applications and persistent volumes from a series of checkpoints. With the Heptio-Microsoft collaboration, the two firms will ensure that organisations are not only able to back up and restore content into Azure Container Service (AKS), but that snapshots created using Ark are persisted in Azure and are encrypted at rest.

Heptio and Microsoft announce technology collaboration

Bringing Heptio Ark disaster recovery and portability to Microsoft Azure

"I'm excited to see Heptio and Microsoft deliver a compelling solution that satisfies an important and unmet need in the Kubernetes ecosystem," said Brendan Burns, distinguished engineer at Microsoft and co-creator of Kubernetes.

It will also help manage disaster recovery for Kubernetes cluster resources and persistent volumes.
