MongoDB Backup

In MongoDB NoSQL, the backup of databases and collections can be retrieved using MongoDB Backup without any issues of size. The connection to Port 27017 of MongoDB can be directly created for the backup of instances and clusters.

Installation is as follows:

```
$ pip install mongodb-backup
```

The documentation and *help* files help keep track of the commands with the options that can be integrated with

MongoDB Backup:

```
$ mongodbbackup --help
```

To take a backup of a single, standalone MongoDB instance, type:

```
$ mongodbbackup -p <port> --primary-ok <Backup-Directory>
```

To take a backup of a cluster, config server and shards, use the following command:

```
$ mongodbbackup --ms-url <MongoS-URL> -p <port> <Backup-Directory>
```

You can use any of these reliable packages available in Python to secure data and back it up, depending on the data that needs to be protected.
