

To participate in Call for Code, developers can register at Callforcode.org. Projects can be submitted by individuals or teams of up to five people between June 18, 2018 and August 31, 2018. Thirty semi-finalists will be selected in September. A prominent jury will choose the winning solution from three finalists. The winner will be announced in October 2018 during a live-streamed concert and award event coordinated by the David Clark Cause.

NEC's Big Data Platform to bring in transparency and efficiency in India's logistics sector

In order to bring in more transparency to India's logistics sector, DMICDC Logistics Data Services Ltd (DLDC) has adopted NEC's Big Data platforms to back its Logistics Data Bank (LDB) project to achieve a digital transformation. DLDC is an entity created by the government of India's National Industrial Corridor Development and Implementation Trust (NICDIT) and Japan based NEC Corporation.

The Big Data platforms include 'Data Platform for Hadoop (DPH)' and 'Data Integration and Analytics Services'. By adopting them, LDB (also known for providing export and import (EXIM) container visibility and managing as much as 70 per cent of India's EXIM container volume) has seen a remarkable enhancement in its ability to collect, store, process and analyse data on a single platform. The platforms also offer an automated reporting process while minimising infrastructure investments.

By replacing manual report creation with an automated option, providing quick and trustworthy analytical reports to customers, and enabling visualisation and development of analytics models along

with the creation of customised reports – all on a single dashboard, DPH has helped the LDB project in shortening the overall workflow for creating reports. It has also reduced the number of analysts by about 70 per cent.

“DPH reduces the lead time for doing meaningful analytics and publishing deep insights for stakeholders. Going forward, DPH will play a major role in compiling complex data from a variety of sources and generating essential market intelligence,” said Piyush Sinha, CEO, DMICDC Logistics Data Services.

In the future, DLDS will expand the adoption of DPH as a common data platform. This will enable enhancements of its existing system capabilities, including the ability to capture data on a real-time basis, perform predictive analytics and deliver new services like transportation route optimisation by analysing IoT data.

openATTIC can simplify software defined storage for all users

SUSE is contributing manpower, concepts and architecture for the openATTIC storage management framework to the Ceph open source project. Its main focus is to turn openATTIC into the new default built-in dashboard for the management and monitoring of the Ceph software defined storage platform.

Apart from flexibility and functionality, the real challenge faced by Ceph is how to simplify its administration and management. Therefore, accessing openATTIC as the default management and monitoring environment will not only help in making it more competitive among other enterprise storage offerings but also provide a common platform for future development and enhancements.

The company will continue to provide the core management expertise and developers to drive the functionality and development of the dashboard within Ceph. This provision will make the storage platform easier to administer and help monitor the project users better, especially those without deep command line experience.

The openATTIC management framework will enable organisations to adapt to changing business and data demands by transforming enterprise storage infrastructure with cost-efficient, highly scalable and resilient storage using commodity off-the-shelf servers and disk drives.
