

## IBM launches Power Systems servers designed for artificial intelligence

IBM has unveiled its next-generation Power Systems servers that incorporate its newly designed POWER9 processor. Built specifically for compute-intensive AI workloads, the new POWER9 systems are capable of improving the training times of deep learning frameworks by nearly four times, allowing enterprises to build more accurate AI applications, faster.

The company claims that new POWER9-based AC922 Power Systems are the first to embed PCI-Express 4.0, next-generation NVIDIA NVLink and OpenCAPI, which when combined can accelerate data movement at a speed that's been calculated at 9.5x faster than PCI-E 3.0 based x86 systems.

The servers are designed to drive demonstrable performance improvements across popular AI frameworks such as Chainer, TensorFlow and Caffe, as well as accelerated databases such as Kinetica.

As a result, data scientists can build applications faster, ranging from deep learning insights in scientific research and real-time fraud detection to credit risk analysis.

IT infrastructure needs to be redesigned for the AI era, to allow analysis of data in milliseconds and enable data-driven decision making. AI workloads demand new hardware and software paradigms and the infrastructure to deliver data-driven workloads. "The P9 architecture aims to transform computing across every industry and profession, turning client data into faster insights where inferences can be drawn quicker, leading to faster time to market," said Viswanath Ramaswamy, director – systems, India/South Asia (IBM).

In the press release, IBM also promised to provide enterprises with an infrastructure that incorporates hardware and software with the latest open source innovations.

### Microsoft's acquisition of GitHub worries developers

Microsoft has announced that it is acquiring GitHub. The companies claim that together, they will empower developers to achieve more at every stage of development.

### EDB and Infosys join hands to boost application and database transformation

EnterpriseDB has collaborated with Infosys to help enterprises modernise their database landscapes, on-premise and in the cloud.

A partnership and solution have been announced by the two digital business players, to support enterprises modernising their application portfolio using the open source-based EDB Postgres platform. The two companies will offer a straightforward alternative to organisations moving away from proprietary databases, while significantly reducing their database total cost of ownership (TCO).

Enterprises today are moving applications away from a legacy monolithic architecture, where the user interface and data access code are combined into a single program from a single platform.

They are heading towards a service-oriented architecture, leveraging the cloud, container, micro-services and new related technologies. The two enterprises have developed automated tools and accelerators to help enterprises make this transformation.

Infosys Code Impact Analyzer combined with the EDB Migration Toolkit significantly decreases the time and risk of moving legacy databases to EDB Postgres.

President and CEO of EnterpriseDB, Ed Boyajian, spoke about the importance of this partnership with Infosys, which will combine application domain and product knowledge with a unique set of automation tools and accelerators that are necessary for successful database migrations at scale.
