

Using Framework7 *to* Build Hybrid Mobile Apps *for* Android and iOS

Mobile apps have become ubiquitous and multi-purpose, and hence we need tools that make it easier to build these apps. Framework7 is open source and enables the building of hybrid mobile apps with the native look and feel of the Android and iOS operating systems. The most important advantage of Framework7 is that developers can use it to build apps swiftly with Web technologies such as HTML, CSS and JavaScript.

It is rather difficult for a mobile app developer to manage separate codebases for different operating systems like Android and iOS. To address this challenge, hybrid mobile apps that require a single codebase have been introduced. This article introduces you to a popular framework to help build these types of apps, called Framework7.

Framework7 is open source and the hybrid mobile apps built with it have the native look and feel of the target operating systems — Android and iOS. Using Framework7, developers can build mobile apps with technologies such as HTML, CSS and JavaScript. The official documentation of Framework7 highlights freedom as its most important design philosophy.

Framework7: The advantages and features

The major advantages and features of Framework7 are listed below:

- The ability to quickly build iOS and Android apps with HTML, CSS and JavaScript. The learning curve associated with Framework7 is very easy to manage.
- The similarity in syntax with jQuery is another important advantage.
- Framework7 can be used along with various other frameworks such as React, Angular, etc.
- The apps built with Framework7 are faster and more responsive. For making the touch UI smoother, it has a built-in FastClick library.
- Dynamic page loading with the help of a flexible router API makes the apps built with Framework7 fully dynamic.
- The app development process is quicker with the availability of widgets and components.

Getting started with Framework7

Framework7 is a recent creation. The first version appeared
