in 2014 and Version 2 was released in February 2018.

The official documentation explains two ways of getting started with building apps with Framework7. The first approach is the separate installation of Framework7 through npm. Another method is to choose from the starter app templates [<https://framework7.io/templates/>].

Now, let us go through the steps to building a simple Android app.

- **Step 1:** Navigate to the URL <https://framework7.io/templates/> to fetch the official Framework7 templates.
- **Step 2:** For the sake of simplicity, select the first template, *Single View*. Click on the *Download* option.
- **Step 3:** Open a terminal on your system. Type the following command to clone the code using Git:

```
git clone https://github.com/framework7io /framework7-
template-single-view my-app
```

- **Step 4:** Install *nodejs* / *npm*, if it is not already installed. After installing npm, type the following command, to install dependencies:

```
npm install
```

- **Step 5:** After successfully installing the required dependencies, you can run the app in the browser, with the following command:

```
npm run serve
```

How the app file is organised can be easily understood. The folder 'www' carries a file named *index.html*. As the name indicates, this is an HTML file that is used to build the skeleton of the app. The 'Pages' folder contains other HTML layout files. The JS folder has the necessary JavaScript files.

The following code snippet shows portions of the *index.html* file. Some of the content has been truncated to reduce the print length.
