

```

<!-- Your custom app scripts -->
<script src="js/app.js"></script>
</body>
</html>

```

The contents modified in the *index.html* file are shown in grey colour for easier identification by the reader.

The contents of the *app.js* file are shown below:

```

var $$ = Dom7;

// Framework7 App main instance
var app = new Framework7({
  root: '#app', // App root element
  id: 'io.framework7.testapp', // App bundle ID
  name: 'Framework7', // App name
  theme: 'auto', // Automatic theme detection
  // App root data
  data: function () {
    return {
      user: {
        firstName: 'OSFY',
        lastName: 'Demo',
      },
    };
  },
  // App root methods
  methods: {
    helloWorld: function () {
      app.dialog.alert('Hello OSFY Reader!');
    },
  },
  // App routes
  routes: routes,
});

// Init/Create main view
var mainView = app.views.create('.view-main', {
  url: '/'
});

```

It can be observed from the above code that the first line uses DOM7, which is a customised Document Object Model library that is high-performance in nature. The use of DOM7 is very similar to jQuery; so, as a programmer, you don't need to learn new syntax. Detailed explanations regarding the functions and properties available for DOM7 are given at <https://framework7.io/docs/dom7.html>. A sample code segment is given below:

```

$$('#something').on('click', function (e) {
  $$(this).addClass('hello').attr('title', 'world').
  insertAfter('.something-else');
});

```

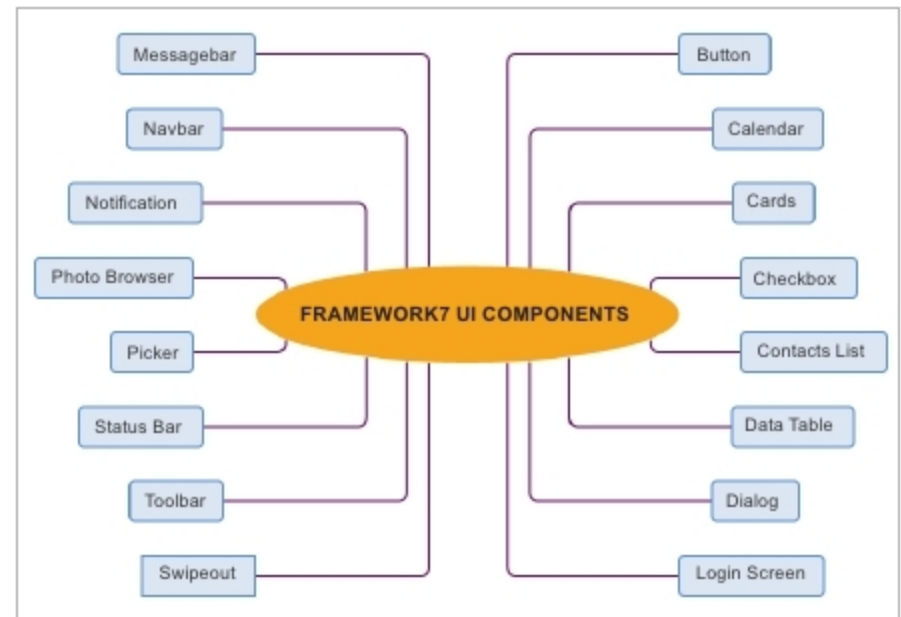

Figure 3: UI components of Framework7

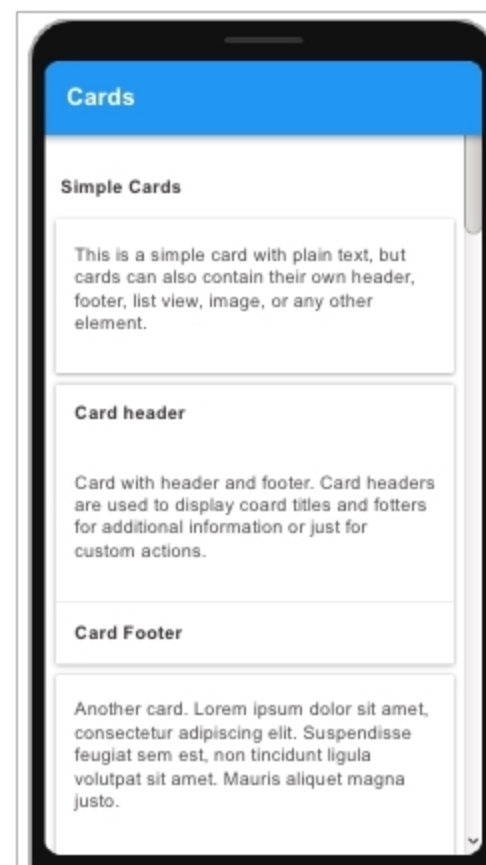

Figure 4: The *Card* UI component in Framework7

Framework7's UI components

One of the important advantages of Framework7 is the availability of a wide range of user interface components. These make the development of apps simpler and swifter. Some of the UI components provided by Framework7 are listed below:

- Button
- Check box
- Calendar
- Contacts lists
- Data table
- Dialog
- Message bar
- Photo browser.

For the complete list of components provided by Framework7, you can refer to the official documentation at <https://framework7.io/docs/>.

Using these UI components is very simple. A code segment to use a sample UI component called 'card' is shown below:

```

<div class="card">

  <div class="card-content card-content-padding">This is a
  simple card with plain text, but cards can also contain their
  own header, footer, list view, image, or any other element.</
  div>
</div>

<div class="card">
  <div class="card-header">Card header</div>
  <div class="card-content card-content-padding">Card with

```
