

header and footer. Card headers are used to display card titles and footers for additional information or just for custom actions.</div>

```
<div class="card-footer">Card Footer</div>
</div>
<div class="card">
  <div class="card-content card-content-padding">Another
card. Lorem ipsum dolor sit amet, consectetur adipiscing
elit. Suspendisse feugiat sem est, non tincidunt ligula
volutpat sit amet. Mauris aliquet magna justo. </div>
</div>
```

The output of the above code is shown in Figure 4.

Framework7's request library

Framework7 has a useful request library to handle Ajax requests (XHR). A sample code snippet to use 'request' is shown below:

```
Framework7.request.get('somepage.html', function (data) {
  console.log(data);
});
```

Device detection with Framework7

Framework7 has a device detection library, which can be used to get important information regarding devices and platforms.

```
if (Framework7.device.android) {
  console.log('It is an Android device');
}
```

Some of the properties of this library are shown in Table 1.

Property	Description
iOS	Returns true, if the device is running iOS
Android	Returns true, if the device is running Android
Windows	Returns true, if the device is running Windows
Desktop	Returns true, if the app is running in a desktop browser
Phonegap/Cordova	Returns true, if the app is running Phonegap/ Cordova environment
OS version	Returns the version of the operating system
Pixel ratio	Returns the device pixel ratio

Table 1: Properties of the device detection library

PhoneGap/Cordova and Framework7

The official documentation provides certain PhoneGap templates to use with Framework7. To download, navigate to <https://github.com/phonegap/phonegap-template-vue-f7-split-panel>.

To build the app, use the following commands:

Step 1:

```
$phonegap create MyAppName --template phonegap-template-vue-f7-split-panel
```

Step 2:

```
$cd MyAppName
```

```
$npm install
```

Step 3: To run it in the browser or simulator:

```
$npm run dev
```

```
$phonegap platform add ios # For IOS simulator
```

```
$npm run cordova-run-ios
```

```
$phonegap platform add android # For Android emulator
```

```
$npm run cordova-run-android
```

Step 4: To make the production app, give the following command:

```
$npm run build
```

Framework7 makes the hybrid mobile app building process easier and more effective. The native look and feel it provides for iOS and Android is an important advantage. One of the limitations of Framework7 is that, in the present state, it supports only iOS and Android. **END** 🐧
