

Flutter: The Fast Way *to* Develop Android *and* iOS Apps

Flutter is a mobile UI framework from Google that helps to build native Android and iOS applications with a single codebase. This article discusses its numerous advantages.

Flutter is free and open source, and its creators state that it provides high-quality native interfaces on Android and iOS in record time. Flutter has been developed to enable the best mobile development experience on different platforms.

The biggest selling point of Flutter is the single codebase. Apps for both Android and iOS can be developed by writing the code just once. No prior experience in mobile development is required to get started with Flutter. As a result, you can start coding right away.

Flutter has been created to help developers to improve the application's quality and speed up the pace of app development in order to reach more users. It is supported by various IDEs

like Android Studio, VS Code and IntelliJ. Information on Flutter, such as the installation steps, features and the getting started guide can be easily found on the website <https://flutter.io/>.

Why Flutter?

Google I/O 2018 has officially declared Flutter to be 'production ready' with the framework being in the Beta 3 stage. The following features of Flutter make it a perfect choice for mobile app development.

- **Faster development:** Flutter provides a tool called 'Hot Reload' to help build features quickly, design UIs faster and enable swift bug fixes. An app can be built in record time with this

super helpful tool.

- **Native performance:** Flutter incorporates the differences between the Android and iOS platforms such as the icons, fonts, navigation, etc, to make sure users get to enjoy a native experience on both platforms.
- **Flexible UI:** The UI experience of native platforms is not lost in Flutter and as a result, developers can provide features that focus on a native end user experience.
- **Modern, reactive framework:** Flutter comprises powerful and flexible APIs for gestures, animations, effects and a lot more. It has a rich set of platforms, layouts and foundation widgets.
