

It has also been designed to overcome many of the key challenges of the financial industry. Being an extension to Ethereum, it basically modifies some part of the Ethereum core and is able to integrate all updates of Ethereum without any hiccups.

Quorum supports:

- Privacy at the transaction level and maintains a wide transparency network; it is highly customised as per the requirements of the business.
- Institutional transaction volumes.

The following libraries have been designed by developers especially for Quorum:

- **Quorum Blockchain Explorer** – This supports viewing of private transactions.
- **Quorum-Genesis** – This is a simple CL utility for Quorum to help populate the genesis file with voters and makers.
- **Quorum Maker** – This is a utility to create Quorum nodes.
- **QuorumNetworkManager** – This

makes creating and managing Quorum networks easy.

- **ERC20 REST service** – This is a Quorum-supported RESTful service for creating and managing ERC-20 tokens.
- **Nethereum Quorum** – This is a

.NET Quorum adapter.

- **web3j-quorum** – This is an extension to the web3j Java library providing support for the Quorum API.

Continued from page 90....

3. Opacity: Everything in iOS has `.opacity` or `.alpha` but in Flutter, we need to wrap the widgets in an Opacity widget.

4. Navigation: In iOS, `UINavigationController` is used to manage the view controllers and Flutter uses `Navigator` and `Routes` to navigate between screens.

Head over to the official website of Flutter at <https://flutter.io/flutter-for-ios/> to find out the various other similarities and differences with iOS.

Flutter for React Native developers

Here is an example of the JS code, where `function` can be the start point:

```
function demoCode() {
  //start
}
```

In the Flutter code, the start point is always the 'main' function:

```
main(){
  //start
}
```

Here is another example of the JS code:

```
var nullVar = null;
if (!nullVar) {
  //do something
}
```

In Flutter, the code is as follows:

```
var nullVar = null;
if (nullVar == null) {
  //do something
}
```

Head over to the official website of

Flutter at <https://flutter.io/flutter-for-react-native/> to find out the various other similarities and differences with React Native.

There's a lot more to Flutter than what has been covered in this article. The native performance, amazing responsiveness, flexible UI and faster development makes it a perfect framework for mobile application development. Flutter has a pretty huge community and, with the latest release, it can be safely said that it is here to stay. The awesomeness of Flutter can only be known if you give it a try. The Google Codelabs (<https://flutter.io/codelabs/>) is a great starting point and will guide you thoroughly through the process.
