

LFN to build harmony between open source and open standards

iconectiv has joined a new open source networking initiative created by The Linux Foundation called LF Networking Fund (LFN). The focus of LFN is to increase collaboration and operational excellence across networking projects, including Open Platform for NFV (OPNFV). This will help deliver a new generation of services.

“The move to hybrid networks that combine physical assets with virtual functions promises enhanced operational efficiencies and speed-to-market for new kinds of services for customers globally. The Linux Foundation understands that the successful integration of these two worlds will require the collaboration of network architects and operators. We intend to offer our intimate knowledge of interconnection as well as network and operations management to help ensure the full rollout and adoption of hybrid networks,” said Alex Berry, executive VP, Information Solutions, iconectiv.

Through a cross-collaboration initiative, LFN, backed by the Linux Foundation, has brought together 100+ member organisations from across the globe. These organisations include networking and enterprise vendors, systems integrators and cloud providers. They are working across nine of the top ten open source networking projects, and are focused on all aspects of the network stack, including NFV (network functions virtualisation), SDN, data IO speed, automation, orchestration, and predictive network analytics. The foundation expects that through LFN, they will be able to create harmony between open source and open standards.

“NFV is an important, highly complex and constantly evolving initiative for the industry. An open source NFV ecosystem developed by the world’s leading telecom experts, that integrates across the stack, benefits the entire industry,” said Arpit Joshipura, general manager, networking, The Linux Foundation.

“With the booming development in container and cloud native technologies, the community needs a reliable industry standard for distribution to allow for increased interoperability along with a neutral home to evolve the specification,”

OPEN CONTAINER INITIATIVE

said Chris Aniszczyk, executive director of OCI.

OCI contributors and maintainers have been hard at work to collaboratively drive the adoption of specifications for the container standards community. This project is the result of extensive work from key maintainers Derek McGowan, Stephen Day and Vincent Batts, with backing from more than hundreds of OCI contributors and organisations committed to container standardisation.

OCI is an open source community for creating open standards around containers. Now that the OCI image and runtime specifications have reached v1.0, it is time to collaborate on developing the OCI specifications for distributing those images.

Deepak Singh, director, compute services, Amazon Web Services, said, “We at AWS are excited to participate actively in these discussions to represent our customers.”

Besides AWS, other technology giants like Huawei, IBM, SUSE and Microsoft are happy to see the community working together to define a container image distribution standard.

The Distribution Specification project aims to keep what works today, working in the future too, while making container-native deployments easier. The OCI distribution specification demonstrates a new level of maturity in the container ecosystem. It will help ensure interoperability and protect customers’ technology investments.

SUSE brings advanced Cloud Foundry productivity to Kubernetes infrastructure

Recently, the Cloud Foundry Foundation recognised SUSE Cloud Application Platform as a Certified Cloud Foundry distribution. The newly certified platform brings the advanced productivity of the Cloud Foundry model to Kubernetes.

SUSE Cloud Application Platform is built with SUSE Linux Enterprise and is backed directly by SUSE. It helps organisations that have invested in Kubernetes infrastructure. The platform eases Cloud Foundry implementation and modern application delivery initiatives. The new Cloud Foundry certification offers customers verified protection against Cloud Foundry vendor lock-in.

“Bridging open source communities, SUSE is bringing together the best of Cloud Foundry and Kubernetes technologies to create compelling new value for our customers,” said Thomas Di Giacomo, SUSE’s CTO. “SUSE’s continuing leadership as a provider of software-defined infrastructure and application delivery solutions is reflected in the innovation contained in the SUSE Cloud Application Platform. Our Cloud Foundry certification signifies the importance to SUSE of interoperability across Cloud Foundry platforms and our commitment to upstream Cloud Foundry development,” he added.
