

Cisco's customers can run production grade containers on any infrastructure

In response to customer feedback, Cisco has unveiled support for Kubernetes in its AppDynamics application performance monitoring (APM) suite. The company has also unveiled Cisco CloudCenter 4.9 for Kubernetes.

Cisco CloudCenter was formerly called CliQr, and could securely deploy and manage applications in multiple environments, including on-premises and on private and public clouds.

CloudCenter 4.9 was made available first, while AppDynamics for Kubernetes became available on May 9. Sources at Cisco say that customers will now be able to run production-grade containers on any infrastructure, via a combination of Cisco CloudCenter 4.9, Cisco Container Platform, and the Google Kubernetes Engine (GKE), which is part of the Google Cloud Platform (GCP).

In an official blog, Kurt Milne from Cisco, said, "Features that make Kubernetes production-grade include automated roll-out and rollback, auto-scaling, and self-healing of containerised applications (among other things)."

Cisco CloudCenter and AppDynamics can be purchased as standalone subscription-based software offers, or bundled via the Cisco Multicloud Portfolio as Cloud Consume. Another option is to get them with Cisco HyperFlex through Cisco SmartPlay bundles.

SUSE OpenStack Cloud 8 makes enterprise customers happy

SUSE has released SUSE OpenStack Cloud 8, its latest enterprise-ready OpenStack Cloud platform, which is based

on OpenStack Pike. It is SUSE's first release to integrate OpenStack Cloud and HPE OpenStack technology. It delivers better interoperability, scalability and flexibility to enable the IT transformation that enterprise customers want, also accelerating the deployment of software-defined infrastructure.

SUSE OpenStack Cloud 8 collaborates with a number of solutions that are developed in association with customers, partners and open source communities to deliver trustworthy innovation and simplify IT transformation, while reducing costs.

Gerald Pfeifer, VP of the products and technology programmes at SUSE, said, "We have applied that know-how to SUSE OpenStack Cloud 8 with new and updated features that will enhance its reputation as the open source cloud solution of choice for enterprises. For customers, the speed, ease and flexibility of deployment make SUSE OpenStack Cloud stand out. The breadth

Forty-one organisations join The Linux Foundation

In a recent development, new members have joined The Linux Foundation, 28 as Silver and 13 as Associate members. The members will help provide the infrastructure and resources that enable the world's largest open collaboration communities. In addition to joining the Foundation, many of the new members have also joined Linux Foundation projects like Automotive Grade Linux, Cloud Native Computing Foundation, EdgeX Foundry, Hyperledger, LF Networking, OpenHPC and more.

The Foundation members help support development of the shared technology resources, while accelerating their own innovation through open source leadership and participation.

"Linux Foundation membership directly supports the growth of open source communities," said Jim Zemlin, executive director, The Linux Foundation. "Participation directly translates to more resources to create code and support developer communities. We appreciate the contributions our newest members have already made, and look forward to working with them to continue to support and grow the open source community," he added.

With the support of its members, the Foundation will continue to host open source projects across networking, security, cloud, blockchain, and many other technologies.
