

Kotlin on the server-side

Kotlin can be used for building server-side applications as well. The following are some of the key advantages of using Kotlin on the server-side.

- **Scalability:** Kotlin has the potential to handle a massive number of clients.
- **Migration support:** There is inbuilt support for migrating large code bases from Java to Kotlin. For server-side development, there are many important frameworks like Vert.x and Ktor.

Kotlin's ability to support large server-side applications is already proven with some major implementations. For example, Corda, which is an open source distributed ledger platform supported by major banks, is built completely with Kotlin.

Java interoperability

As stated earlier, Kotlin supports interoperability with Java. The existing Java code can be called from Kotlin in a seamless manner. A comparative analysis of Kotlin and Java is provided at <https://kotlinlang.org/docs/reference/comparison-to-java.html>. Some of the prominent advantages of Kotlin are listed below:

- Has a null safety feature
- Has extension functions
- Operator overloading is allowed
- Implements coroutines

The official documentation claims that Kotlin code is more compact than Java code. In fact, it shows an estimated 40 per cent reduction in the number of lines of code with Kotlin (<https://kotlinlang.org/docs/reference/faq.html>).

To know more about Kotlin, refer to the many books available. A list is given at <https://kotlinlang.org/docs/books.html>.

With its multi-platform support and concise code, Kotlin surely has the potential to evolve into one of the most popular programming languages for developers across the spectrum. **END** 🐧
