

Infosys is the first global solutions partner in the SUSE Partner Programme

Infosys has become the first global solutions partner in the top tier of the SUSE Partner Programme. It has chosen SUSE Linux Enterprise Server for SAP Applications.

Infosys has developed solutions around SAP and ecosystem applications on the company's managed private cloud.

"As SUSE works to equip enterprise customers to adapt quickly to market changes, we arm our partners with the technology and expertise to do the same. Infosys is a tremendous global solutions partner, and is helping customers transform their data centres to stay competitive while maintaining high levels of reliability, availability and security," said Mark Salter, VP of channels for SUSE.

SUSE's open source approach means it works with customers' preferred partners and vendors to help them succeed. The SUSE Partner Programme makes it easier for these preferred channel partners to address the key needs of their customers with training and certification pathways, along with incentive structures that recognise and reward partners' engagements with SUSE.

The programme also supports SUSE's software-defined infrastructure and application delivery solutions, and focuses on specific solution areas for channel partners—enterprise Linux, software-defined storage, OpenStack cloud and systems management.

product developers to high school students—the opportunity to innovate on new electronics concepts," said Dr Benjamin Leever, the AFRL Advanced Development Team leader and NextFlex Government CTO.

Arduinos are microcontrollers, or integrated circuits, that are programmable through open source software. They can be used by anyone to quickly prototype an electronic device.

The flexible Arduino circuit board can enable rapid innovation in flexible and wearable devices for applications including monitoring a person's hydration status, glucose levels, heart rate and more. In the process of developing the flexible hybrid device, the NextFlex team reduced the number of manufacturing process steps by more than 60 per cent and the weight of the circuit by 98 per cent, ultimately increasing the possibilities for design applications. The high performance of a traditional microcontroller circuit is maintained through this combination of surface-mounted and printed features.

Leveraging on the open source community built around Arduino helped the US Air Force accelerate innovation, enabling new technologies with tremendous potential. The NextFlex institute played a key role in this innovation process, and acted as a valuable asset for the US Department of Defense and the industry.

LibreOffice 6.0 arrives!

With a bunch of tweaks, open source productivity suite LibreOffice has reached version 6.0. The release is nicely timed with the seventh anniversary celebrations of LibreOffice, a popular alternative to Microsoft Office. Updates for LibreOffice 6.0 are available across Windows, Linux and macOS, with cloud augmentation to allow users to work on the Web too.

The security features include experimental support of OpenPGP encryption (subject to compatible companion software) and document classification that allows multiple policies and signing/markings at a paragraph level. Version 6.0 of LibreOffice offers general spell-checking improvements, which can speed up the work of writers. Instead of the manual handling of hundreds of correct word forms of a new word in a language with rich morphology or compounding, the Hunspell spell-checker will recognise the new user dictionary word with affixes or in compounds, too, based on a 'Grammar By' model word.

The cloud version has been tweaked to further match the desktop edition with cell support in CALC raised to half a million, a 'Save As' feature for embedded images and a 'Find and Replace' dialogue box. For those who want to go under the hood, the source code for LibreOffice online is available as a Docker image. You can also import files from QuarkExpress.

For enterprises though, The Document Foundation suggests that, "LibreOffice 6.0 represents the bleeding edge in term of features for open source office suites, and as such, is targeted at technology enthusiasts, early adopters and power users."

An improved Form menu has been added to LibreOffice 6.0 for designing forms, and there's easier access to special characters—great for those of us that type 'µ' a lot. A version for Android is also in the works, scheduled for a spring release, which will, amongst other things, allow users to add photos from their phones directly into projects.

Second distributed ledger project from Hyperledger announced

The newly released Sawtooth 1.0 joins its sister project, Hyperledger Fabric 1.0, which was released in July last year. Today, on-chain governance is popular when
