

inside a data centre at the core of the network. SQLite works there too, but SQLite also thrives at the edge of the network, fending for itself while providing fast and reliable data services to applications that would otherwise have dodgy connectivity.

The advantages of using SQLite for IoT data include:

- 1) Offers a small memory footprint
- 2) It is authentic
- 3) No setting up required prior to use
- 4) Has no dependencies

Apache Cassandra: Apache Cassandra is a free and open source distributed NoSQL database management system, which was initially released in 2008. It was intended to handle huge amounts of data through many commodity servers, providing high availability with no single point of failure.

In IoT, the generation, tracking and sharing of data through a variety of networks is carried out on an immense scale due to the massive number of connected devices. Cassandra is excellent at utilising lots of time series data that comes directly from devices, users, sensors, and similar mechanisms that subsist in diverse geographic locations.

The advantages of using Apache Cassandra for IoT data include:

- 1) Fault tolerant
- 2) Demonstrates high performance
- 3) *Decentralised:* Every node in the cluster is identical
- 4) Scalable

- 5) Durable
- 6) *Ensures you're in control:* Each update has a choice of synchronous and asynchronous replication
- 7) *Elastic:* Both read and write execute in real-time, thus there is no downtime for any application
- 8) *Professionally supported:* It reinforces contracts and services that are available from third parties.
