

Open source SDK from Tap Systems

Tap Systems, Inc. has released a software developer kit (SDK), which enables the design of applications that incorporate and/or include the Tap wearable and its functionality.

As the name suggests, the Tap wearable sits at the base of your fingers and senses finger taps as input. With Bluetooth connectivity, Tap users can currently compose text, play games, point, click and scroll using just about any available surface—all this without compromising on the comfort of wearing it. “Since Tap’s inception, we’ve been contacted by everyone, from mobile game and language input developers, to folks developing for accessibility use and even enterprise,” said Dovid Schick, CEO and founder of Tap Systems. “The Tap has so much potential and we are excited to share our SDK with the developer community to see what amazing applications and uses people come up with.”

Tap gives game developers an opportunity to create novel game play experiences and increase engagement by utilising the precision and diversity of its input. These games can easily be ported between mobile, console and desktop platforms, while preserving the same game interface.

Augmented reality (AR) and virtual reality (VR) developers can now use Tap for eyes-free control and input for their virtual environments. Tap can also be used by language input developers to customise letters of the alphabet

Tap System’s released toolset includes SDKs for both iOS and Android, a plug-in for Unity, as well as examples of applications and documentation. The company has also released an API to enable any BLE enabled platform to interface directly with the Tap wearable.

Tap Systems has invited interested developers to be a part of the Tap developer community and get updates, news and support.

According to media reports, this is a testament to the backward compatibility of Windows itself, especially since this version was originally included in Windows more than 20 years ago.

First released for Windows 3.0, the file manager was a replacement for managing files through MS-DOS, and allowed Windows users to copy, move, delete and search for files.

SAT InfoTech recognised as SUSE Solution Partner

Hyderabad based SAT InfoTech has been a partner with SUSE for the past seven years. And now, SUSE has recognised its extensive support to SUSE products.

An open source evangelist and SAP management consulting company, SAT InfoTech has been made a Solution Partner in the SUSE Partner Program. Being the highest tier in the Partner Program, this categorisation is awarded to companies that

have invested in becoming highly skilled in implementing and supporting SUSE products.

SAT InfoTech has also been committed to joint business planning with SUSE. It specialises in deploying and supporting SAP landscapes. The firm has been involved in SAP migrations and high availability projects for prestigious

organisations across India. SAT InfoTech’s consulting division has implemented SUSE Enterprise Storage, SUSE OpenStack Cloud, SUSE Manager and Live Patching for a range of customers.

SUSE Linux works across on-premise, private and public cloud deployments and SAT InfoTech will incorporate it with its KavsK (ka-sk) Cloud Management Platform.

“We are happy that SAT InfoTech has now attained the Solution Partner level in our highly regarded SUSE Partner Program. SUSE Linux Enterprise Server for SAP Applications provides enduring opportunities for customers and with the portfolio SAT InfoTech has, it makes the firm a perfect fit for our solution partner level,” said Rajarshi Bhattacharyya, country head, SUSE.

“SAT InfoTech brings with it a deep technical skill set, and has demonstrated a commitment to SUSE, by achieving the highest technical certifications available across Linux, storage, OpenStack cloud and systems management, making it one of our most highly skilled partners in India. We’re confident that by working together, our joint customers can get the most ROI from their SAP applications,” said Mark Salter, VP, channels at SUSE.

NETL releases CCSI toolset as open source software

National Energy Technology Laboratory (NETL), USA, has released the carbon capture simulation toolset, i.e., CCSI as open source software. The CCSI toolset is a suite of computational tools and models designed to help maximise learning, and reduce costs and risks during the scale-up process for carbon capture technologies.

The Carbon Capture Simulation Initiative (CCSI) is led by the Office of Fossil Energy (FE). The CCSI toolset takes care of the design and calculations, thus reducing the cost of both pilot projects and commercial facilities. The toolset is hosted on GitHub.
