

```

<script>transform.q</script>
</hive>

<ok to="load"/>
<error to="fail"/>

<action name="load">
<hive xmlns="uri:oozie:hive-action:0.2">
<configuration>
<property>
<name>mapred.job.queue.name</name>
<value>${queueName}</value>
</property>
<property>
<name>oozie.hive.defaults</name>
<value>/user/rkkrishnaa/oozie/hive-site.xml</value>
</property>
</configuration>
<script>load.q</script>
</hive>

<ok to="end"/>
<error to="fail"/>
</action>
<kill name="fail">
<message>Sqoop failed, error message[${wf:errorMessage(wf:lastErrorNode())}]</message>
</kill>
<end name="end"/>
</workflow-app>

```

Step 3: Create the file *transform.q*:

```
LOAD DATA INPATH 'hdfs://hadoop_sahara_local/user/rkkrishnaa/
databases${date}/files.csv'
```

Step 4: Create the file *load.q*:

```
SELECT name, age, department from sales_department where
experience > 5;
```

The above workflow job will do the ETL operation. We can customise the workflow job based on our own use case. There are a lot of mechanisms to handle task failure in our workflow job. Email action helps to track the status of the workflow task. This ETL job can be executed on a daily or weekly basis, at any time. Usually, organisations perform these long running tasks during weekends or at night.

To know more about workflow action, check out <https://oozie.apache.org/docs/3.3.1/index.html>.

OpenStack has integrated a very large Hadoop ecosystem to its universe. Many cloud providers offer the Hadoop service with just a few clicks on their cloud management portal. OpenStack Sahara proves the ability and robustness of OpenStack infrastructure. According to an OpenStack user survey, very few organisations have adopted the Sahara service in their private cloud. Sahara supports most of the Hadoop vendor plugins to operate the Hadoop workload effectively. So, go ahead and execute your ETL workflow with OpenStack Sahara.
